

Chap 8: Techniques of integration

8.1: Integrals by Parts

$$\int u \, dv = uv - \int v \, du$$

$$\int_a^b u \, dv = uv \Big|_a^b - \int_a^b v \, du$$

• How to solve Exercises?

- you need to decide which of the two functions is u and the other will represent dv
- u doesn't have to be the first function
- after that u need to organize the functions
let's say we have $\int x \cos x \, dx$

→ $u = x$ $dv = \cos x \, dx$
 $du = dx$ $v = \sin x$
- $\int v \, du$

نشتو $u \times v$ $\int u \, dv$

- There is another way to solve These integrals
Note: it works only if one of the functions can be derived to zero.

Ex: $x \Rightarrow 1 \Rightarrow 0 \checkmark$

if so :-

$x \downarrow \rightarrow 1 \downarrow \rightarrow 0$
 $\cos x \downarrow \rightarrow \sin x \downarrow \rightarrow -\cos x$
+ $-$

Some integrals that you have to know By *hevel* :-

* $\int \ln x \, dx$

$$\begin{aligned} u &= \ln x & dv &= dx \\ du &= \frac{1}{x} & v &= x \end{aligned}$$

$$\int \ln x \, dx = \int u \, dv$$

$$= x \ln x - \int \frac{1}{x}(x) \, dx$$

$$= x \ln x - x + C$$

* $\int e^x \sin x \, dx$

$$\begin{aligned} u &= e^x & dv &= \sin x \, dx \\ du &= e^x & v &= -\cos x \end{aligned}$$

$$\int e^x \sin x \, dx = \int u \, dv$$

$$= -e^x \cos x + \underbrace{\int e^x \cos x \, dx}$$

$$\int e^x \cos x \, dx$$

$$u = e^x$$

$$du = e^x$$

$$dv = \cos x \, dx$$

$$v = \sin x$$

$$\int e^x \cos x \, dx = \int u \, dv$$

$$= e^x \sin x - \int e^x \sin x \, dx$$

• Now Back to the equation

$$\int e^x \sin x \, dx = -e^x \cos x + e^x \sin x - \int e^x \sin x \, dx$$

$$2 \int e^x \sin x \, dx = e^x (\sin x - \cos x)$$

$$\int e^x \sin x \, dx = \frac{e^x (\sin x - \cos x)}{2} + C$$

طريقة أخرى :-

$$\begin{array}{l} e^x \quad \swarrow \quad \sin x \\ e^x \quad \searrow \quad -\cos x \\ e^x \text{ stop } \quad \rightarrow \quad \sin x \end{array}$$

$$\int e^x \sin x \, dx = -e^x \cos x + e^x \sin x + \int e^x (-\sin x) \, dx$$

$$\Rightarrow \int e^x \sin x \, dx = e^x [\sin x - \cos x] - \int e^x \sin x \, dx$$

$$\int e^x \sin x \, dx = \frac{e^x [\sin x - \cos x]}{2}$$

8.2 Trigonometric integrals

⚠ How to integral $\int \cos^m x \sin^n x dx$?

Answer:- 11 If m is odd (فردی)

Then $m = 2K + 1$

$$\begin{aligned}\Rightarrow \cos^m x &= \cos^{2K+1} x \\ &= [\cos^2 x]^K \cos x \\ &= [1 - \sin^2 x]^K \cos x\end{aligned}$$

Then let $u = \sin x$

and $du = \cos x dx$

12 If n is odd $\Rightarrow n = 2K + 1$

$$\begin{aligned}\sin^n x &= \sin^{2K+1} x \\ &= [\sin^2 x]^K \sin x \\ &= [1 - \cos^2 x]^K \sin x\end{aligned}$$

Then let $u = \cos x$

$du = -\sin x dx$

13 If n and m are both even then:-

$$\text{we use: } \sin^2 x = \frac{1 - \cos 2x}{2} \rightarrow \cos 2x = 1 - 2\sin^2 x$$

$$\cos^2 x = \frac{1 + \cos 2x}{2} \rightarrow \cos 2x = 2\cos^2 x - 1$$

• Another case is when m and n are not powers
But constants to the variable x :-

$$1 - \int \sin mx \cos nx \, dx$$

$$= \frac{1}{2} \int [\sin(m-n)x + \sin(m+n)x] \, dx$$

$$2 - \int \sin mx \sin nx \, dx$$

$$= \frac{1}{2} \int [\cos(m-n)x - \cos(m+n)x] \, dx$$

Identical
But instead of
- we use +

$$3 - \int \cos mx \cos nx \, dx$$

$$= \frac{1}{2} \int [\cos(m-n)x + \cos(m+n)x] \, dx$$

cos 11 jobs cos sin jobs sin .

Powers of tan and sec :-

$$\textcircled{1} \int \tan^3 x \, dx$$

$$= \int \tan^2 x \tan x \, dx$$

$$= \int (\sec^2 x - 1)(\tan x) \, dx$$

we separate them

$$= \int \sec^2 x \tan x \, dx - \int \tan x \, dx$$

$$\text{let } u = \tan x \\ du = \sec^2 x \, dx$$

$$= \int u \, du - \int \frac{\sin x}{\cos x} \, dx$$

$$= \frac{u^2}{2} + \int \frac{(\cos x)'}{\cos x} \, dx$$

$$= \frac{\tan^2 x}{2} + \ln|\cos x| + C$$

✗

$$2- \int \sec^4 x \, dx$$

$$= \int \sec^2 x \sec^2 x \, dx$$

$$= \int (1 + \tan^2 x) \sec^2 x \, dx$$

$$\text{let } u = \tan x \\ du = \sec^2 x$$

$$= \int (1 + u^2) \, du$$

$$= u + \frac{u^3}{3} + C = \tan x + \frac{\tan^3 x}{3} + C$$

Trigonometric substitution

$$X = a \tan \theta$$

$$dX = a \sec^2 \theta d\theta$$

$$\theta = \tan^{-1}\left(\frac{X}{a}\right)$$

$$-\frac{\pi}{2} < \theta < \frac{\pi}{2}$$

which means $\cos \theta$ is always positive

$$\sqrt{x^2 + a^2} = \sqrt{a^2 \tan^2 \theta + a^2} = \sqrt{a^2 (\tan^2 \theta + 1)} = \sqrt{a^2 \sec^2 \theta} = a |\sec \theta|$$

But $\sec \theta > 0$ Then $= a \sec \theta$

$$X = a \sin \theta$$

$$d\theta = a \cos \theta d\theta$$

$$\theta = \sin^{-1}\left(\frac{X}{a}\right)$$

$$-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$$

which means $\cos \theta$ is always positive

$$\sqrt{a^2 - x^2} = \sqrt{a^2 - a^2 \sin^2 \theta} = \sqrt{a^2 (1 - \sin^2 \theta)} = \sqrt{a^2 \cos^2 \theta} = a |\cos \theta|$$

But $\cos \theta > 0 \Rightarrow = a \cos \theta$

$$X = a \sec \Theta$$

$$dx = a \sec \Theta \tan \Theta d\Theta$$

$$\Theta = \sec^{-1} \left(\frac{X}{a} \right)$$

There is 2 cases

$$\text{Case ①:- } \frac{X}{a} \geq 1 \Rightarrow 0 \leq \Theta \leq \frac{\pi}{2}$$

$$\text{Case ②:- } \frac{X}{a} \leq -1 \Rightarrow \frac{\pi}{2} < \Theta \leq \pi$$

In our Book we only deal with Case ①:-

$$\sqrt{x^2 - a^2} = \sqrt{a^2 \sec^2 \Theta - a^2} = \sqrt{a^2 (\sec^2 \Theta - 1)} = \sqrt{a^2 \tan^2 \Theta} = a \tan \Theta$$

Since we are only dealing with Case ①

$$\text{Then } \Rightarrow = a \tan \Theta$$

4 Integration of Rational functions using Partial fractions

①

* A Rational function is : $\frac{f(x)}{g(x)}$

• How to integrate it?

→ The idea of using Partial fraction is to re-write the Rational function $\frac{f(x)}{g(x)}$ as a sum of Partial "simpler" fractions That are easy to integrate

• There are 2 cases :-

1] The degree of $f(x) \geq$ The degree of $g(x)$

→ we use long division

2] The degree of $f(x) <$ The degree of $g(x)$

→ we have the following cases :-

a] if $g(x)$ is a product of linear distinct factors

Then we use Cover Method

b] otherwise we use different approaches

• Remark:- If in case a The products were not distinct : for example:-

$$\frac{1}{(x-1)^2}$$

we use the cover method but with some changes

$$\frac{1}{(x-1)^2} = \frac{A}{(x-1)} + \frac{B}{(x-1)^2}$$

Another example:-

$$\frac{1}{(x^2+1)^2} = \frac{Ax+B}{x^2+1} + \frac{Cx+D}{(x^2+1)^2}$$

Explanation of the cover method:-

for example: $\int \frac{(x+5)}{(x-4)(x+1)}$

$$\frac{(x+5)}{(x-4)(x+1)} = \frac{A}{(x-4)} + \frac{B}{(x+1)}$$

$$\frac{(x+5)}{(x-4)(x+1)} = \frac{A(x+1)}{(x-4)(x+1)} + \frac{B(x-4)}{(x-4)(x+1)}$$

محدد تو هـ ولقومات

$$x+5 = A(x+1) + B(x-4)$$

الآن نختار قيمتين عشوائيتين

$$\textcircled{1} -1+5 = 0 + -5B$$

د X لـ كـ نـ بـ A و B

$$B = -\frac{4}{5}$$

و نفضل انه يكون الصـ

نـ صـ فـ حـ اـ A صـ و نـ صـ

$$\textcircled{2} 4+5 = 5A + 0$$

حـ اـ B صـ اـ صـ

و هنا يكون هذه الصـ

$$x = -1/4$$

$$A = \frac{5}{4} \frac{9}{5}$$

or :-

$$\frac{(x+5)}{(x-4)(x+1)} = \frac{A}{(x-4)} + \frac{B}{(x+1)}$$

لـ بـ اـ A

نـ اـ حـ فـ حـ x

الـ نـ صـ فـ حـ اـ

نـ بـ اـ (x-4)
و نـ صـ
الـ 4
نـ بـ اـ حـ فـ حـ

نـ بـ صـ حـ اـ A

$$A = \frac{4+5}{4+1} = \frac{9}{5}$$

نـ بـ B نـ صـ حـ اـ x = -1/4

• Explanation of the long division

Exp $\int \frac{x^3}{x^2 - 2x + 1} dx$

$$\begin{array}{r}
 x+2 \\
 x^2-2x+1 \overline{) x^3} \\
 \underline{x^3-2x^2+x} \\
 2x^2-x \\
 \underline{2x^2-4x+2} \\
 3x-2
 \end{array}$$

① ضرب المقسوم عليه بـ x

② طرح $x^3 - 2x^2 + x$ من x^3

③ ضرب المقسوم عليه بـ 2

④ طرح $2x^2 - 4x + 2$ من $2x^2 - x$

$$\int \frac{x^3}{x^2 - 2x + 1} dx = \int (x+2) + \frac{3x-2}{(x^2 - 2x + 1)}$$

⑤ نضع الجواب + الباقي
