WordNet and Global WordNet

Part 1: The English WordNet

- Part 2: Euro WordNet
- Part 3: Global WordNet

Lecture Keywords:

WordNet, Global WordNet, Thesaurus, Linguistic Ontology, Lexical Semantics, Semantics, Meaning, Synset, Concept, Synonymy, Polysemy, Hyponymy, Meronymy, Antonymy, شبكة المفردات، مكنز، انطولوجيا للغة، علم الدلالة، الدلالة، المعنى، المفهوم، تعدد اللغات، الترادف اللغوي، تعدد المعاني، التضاد، تصنيف المعاني، علاقات

جزء-کل

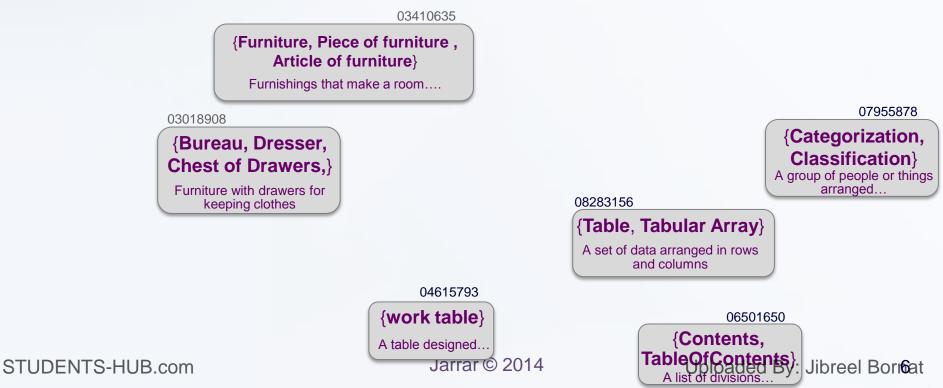

What is WordNet?

- In 1985 a group of psychologists and linguists at Princeton University started to develop a "mental lexicon".
- You may also call it: "electronic dictionary", "Mental dictionary", English,
 "semantic Network", hyperdimensional thesaurus, etc.
- Includes most frequent words (nouns, adjectives, adverbs, verbs).
- Organized by meaning: words in close proximity are semantically similar.
- Can be used by humans and machines.
- Human users and computers can browse WordNet and find words that are meaningfully related to their queries.
- Available online, for downloading! http://wordnet.princeton.edu

WordNet: Synonymy

WordNet gives information about two fundamental, universal properties of human language: **polysemy** and **synonymy**.

- English words are grouped (roughly) into sets of synonyms.
- Each set of synonyms is called a Synset; and given a unique SynsetID to identify it.
- Each synset expresses a distinct meaning/concept.

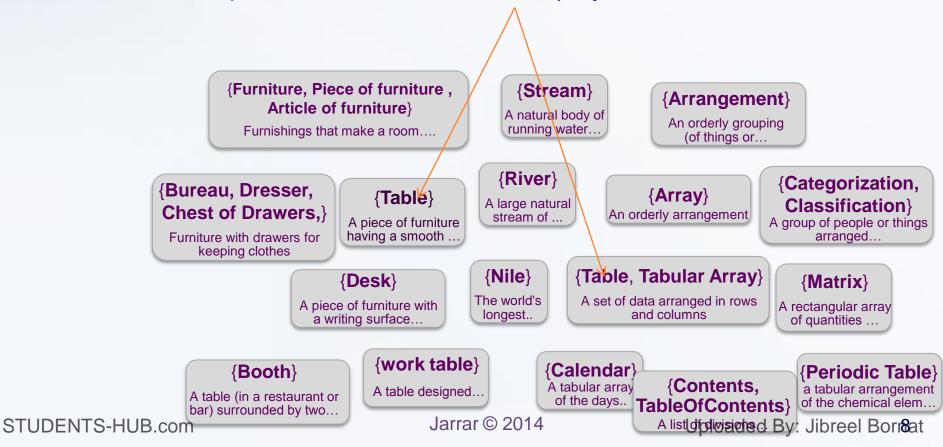

Exercise

List the different meanings of the words: Table, Array, Matrix, Bureau

WordNet: Polysemy

- Each word form-meaning pair is unique.
- A word that appears in n synsets is n-fold polysemous.
- For example: "Table" here is two-fold polysemous

WordNet: Glosses

A short gloss is provided for each sysnet.

Glosses are examples of contexts for many word-sense pairs, telling us how words with specific senses are being used in context.

WordNet: Statistics

155 287 word forms, groups into 117 659 synsets

	WordForms	Synsets
noun	117,798	82,115
verb	11,529	13,767
adjective	21,479	18,156
adverb	4,481	3,621
Total	155,287	117,659

WordNet Semantic Relations

Synsets are interconnected with semantic relations, forming a large semantic network (graph).

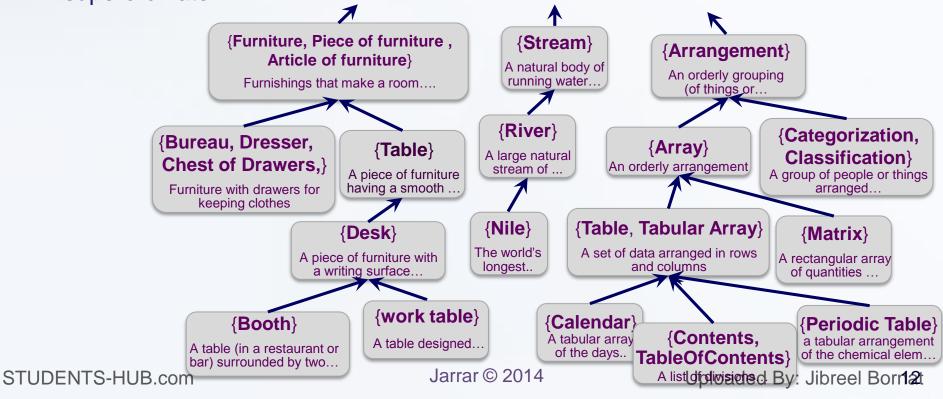

Such Relations are:

- Hyponymy, also called "Is a" relation, or sub/superordinate.
- Meronymy, also called "part of" relation

WordNet Relations: Hyponymy

- A synset {x, x', . . .} is hyponym of the synset {y, y', . . .} if native English speakers accept sentences like x is a (kind of) y. E. g., Table/Tabular Array is a kind of Array, Array is a kind of Arrangement,...
- Hyponymy is transitive and asymmetrical. So as Hyponymy generates a
 hierarchical semantic structure, a hyponym inherits all the features of the more
 generic concept and adds at least one feature that distinguishes it from its
 superordinate.

WordNet Relations: Hyponymy

- A synset {x, x', . . .} is hyponym of the synset {y, y', . . .} if native English speakers accept sentences like x is a (kind of) y. E. g., Table/Tabular Array is a kind of Array, Array is a kind of Arrangement,...
- Hyponymy is transitive and asymmetrical. So as Hyponymy generates a
 hierarchical semantic structure, a hyponym inherits all the features of the more
 generic concept and adds at least one feature that distinguishes it from its
 superordinate. [2]

The WordNet hierarchy is about 16 levels

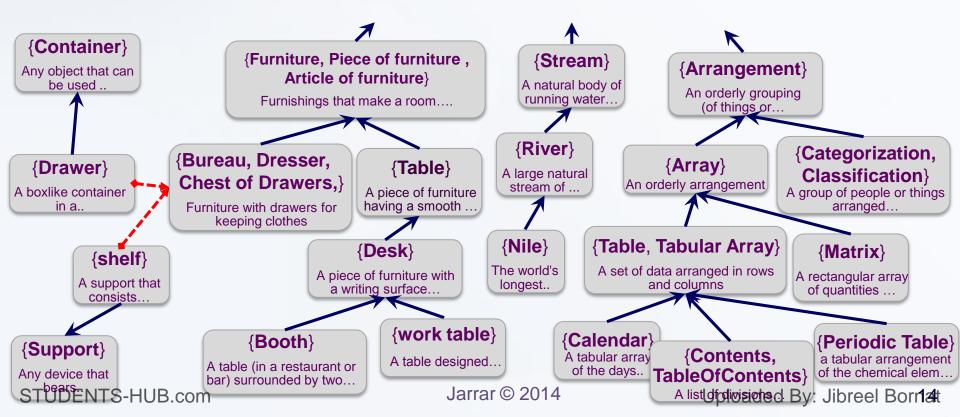

Top Level Nouns (25 unique beginners)

```
{act, action, activity}
                                  {natural object }
{animal, fauna}
                                  {natural phenomenon }
                                  {person, human being}
{artifact }
{attribute, property }
                                  {plant, flora}
{body, corpus}
                                  {possession}
{cognition, knowledge}
                                   {process}
{communication}
                                  {quantity, amount}
{event, happening}
                                  {relation }
{feeling, emotion}
                                  {shape}
                                  {state, condition}
{food}
{group, collection}
                                  {substance}
{location, place }
                                  {time}
{motive}
```

Jarrar © 2014

WordNet Relations: Meronymy

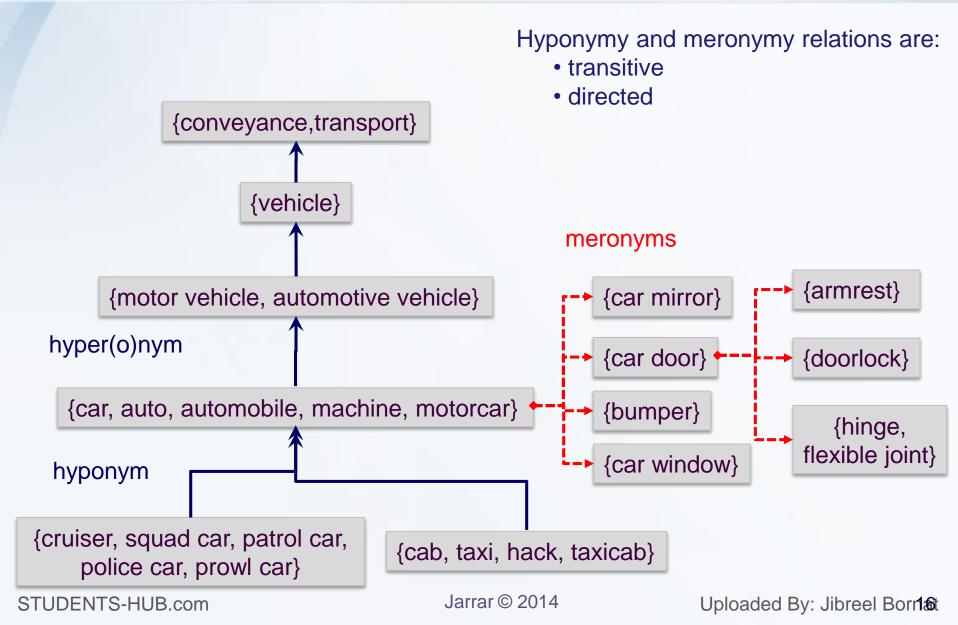

- A synset {x, x', . . .} is meronym of the synset {y, y', . . .} if native English speakers accept sentences like y has an x (as a part) or An x is a part of y. E. g., Finger is part of Hand, Hand is part of Arm, Arm is part of Body.
- Meronymy is transitive (with qualification) and asymmetrical relations, and forms a part hierarchy..
- Synsets may have multiple hypernyms

Exercise

Find the hyponyms and meronyms of this synset

{car, auto, automobile, machine, motorcar}

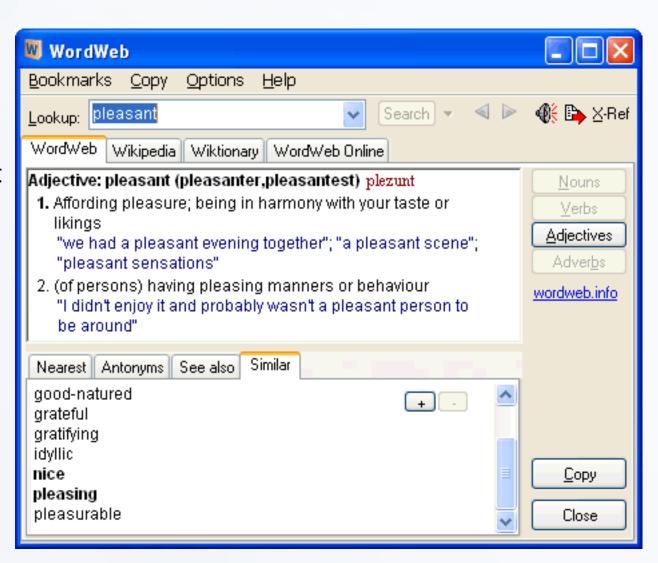

WordNet Relations: Antonymy

- The antonym of a word x is sometimes not-x, but not always. For example, *rich* and *poor* are antonyms, but to say that someone is not rich does not imply that they must be poor; many people consider themselves neither rich nor poor.
- Antonymy, which seems to be a simple symmetric relation, is actually quite complex, yet speakers of English have little difficulty recognizing antonyms when they see them. For example, the meanings {rise, ascend } and {fall, descend} may be conceptual opposites, but they are not antonyms; [rise/fall] are antonyms and so are [ascend/descend], but most people hesitate and look thoughtful when asked if rise and descend, or ascend and fall, are antonyms
- Antonymy is a lexical relation between word forms, not a semantic relation between word meanings. Or, some call it semantic relations between words [MPC93].

A nice and intuitive interface for WordNet

Other WordNet Relations

- Although the main interest of WordNet was on specifying semantic relations but other lexical/morphological relations between word forms were added.
- For example: stems, singular-plural, verb tenses, etc.

Why do we need WordNet?

- Word sense disambiguation,
- Information retrieval,
- Automatic text classification,
- Automatic text summarization,
- Machine translation
-etc.

Yes:

it groups together meaningfully related words

No:

- WN labels the relations
- The relations are limited
- Related words are linked to specific concepts (disambiguated);
 thesaurus is a "bag of words"
- Many words linked in WordNet do not co-occur in the same thesaurus entry
- WordNet allows one to measure and quantify the semantic similarity or distance among words and concepts

Is WordNet an Ontology?

Meaning (called Ontological Precision):

WordNet: based on what native speakers agree roughly Ontology: based on Scientific and philosophical findings.

Classification:

WordNet: based on what native speakers agree roughly (Student IsA person)

Ontology: based on strict formal methodologies (student IsA role)

Formal Specification:

WordNet: logically vague Ontology: strictly formal

- → I like to use WordNet as a linguistic ontology, though it needs lots of cleaning!
- → Linguistic ontologies are difficult to build but they are immune to changes

WordNet and Global WordNet

Part 1: The English WordNet

Part 2: Euro WordNet

Part 3: Global WordNet

- The development of a multilingual database with WordNets for several European languages.
- Funded by the European Commission, DG XIII, LE2-4003 and LE4-8328
- March 1996 September 1999 (2.5 Million EURO)
 http://www.hum.uva.nl/~ewn
 http://www.illc.uva.nl/EuroWordNet/finalresults-ewn.html

Languages covered:

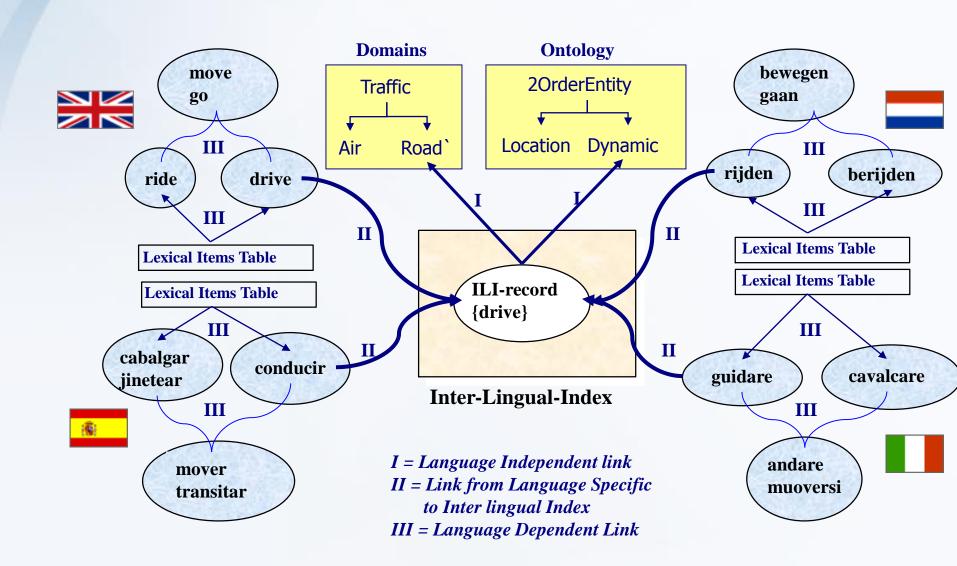

EuroWordNet-1 (LE2-4003): English, Dutch, Spanish, Italian EuroWordNet-2 (LE4-8328): German, French, Czech, Estonian.

Size of vocabulary:

EuroWordNet-1: 30,000 concepts - 50,000 word meanings. EuroWordNet-2: 15,000 concepts - 25,000 word meaning.

Type of vocabulary:

the most frequent words of the languages all concepts needed to relate more specific concepts.

- Inter-Lingual-Index: unstructured fund of concepts to provide an efficient mapping across the languages;
- Index-records are mainly based on WordNet synsets and consist of synonyms, glosses and source references;
- Various types of complex equivalence relations are distinguished;
- Equivalence relations from synsets to index records: not on a word-toword basis;
- Indirect matching of synsets linked to the same index items;

- WordNets are unique language-specific structures:
 - same organizational principles: synset structure and same set of semantic relations.
 - different lexicalizations
 - differences in synonymy and homonymy:

"decoration" in English versus "versiersel/versiering" in Dutch

"bank" in English (money/river) versus "bank" in Dutch (money/furniture)

•BUT also different relations for similar synsets

- Construction is not done uniformly
- Coverage differs
- Not all wordnets can communicate with one another, i.e. linked to different versions of English wordnet
- Proprietary rights restrict free access and usage
- A lot of semantics is duplicated
- Complex and obscure equivalence relations due to linguistic differences between English and other languages

WordNet and Global WordNet

- Part 1: The English WordNet
- Part 2: Euro WordNet

From EuroWordNet to Global WordNet

http://www.globalwordnet.org

The Global WordNet Association

- <u>GWC2012 Conference</u>
- Wordnets in the world

- Previous GWA Conferences
- Base Concepts
- · The Global Wordnet Grid
- Membership form
- Mailing list
- · The Constitution
- · The Board
- Background document

The Global WordNet Association is a free, public and non-commercial organization that provides a platform for discussing, sharing and connecting wordnets for all languages in the world. The aims of the association are:

- To establish distribution facilities for the dissemination of the Association and Association publications and information materials:
 - To promote cooperation and information exchange among related professional and technical societies that build or use wordnets.
 - To provide information on wordnets to the general public.
- To promote the standardization of the specification of wordness for all languages in the world, including:
 - the standardization of the Inter-Lingual-Index for inter-linking the wordness of different languages, as a universal index of meaning
 - the development of a common representation for wordnet data
- To promote the development of sense-tagged corpora in all the linked languages.
- To promote sharing and transferring of data, software and specifications across wordnet builders for different languages
- To promote the development of guidelines and methodologies for building wordness in new languages
- 6. To promote the development of explicit criteria and definitions for verifying the relations in any

Jarrar © 2014

Uploaded By: Jibreel Bord

- EuroWordNet ended in 1999
- Global Wordnet Association was founded in 2000 to maintain the framework: http://www.globalwordnet.org
- Currently, wordnets exist for more than 50 languages, including:

Arabic, Bantu, Basque, Chinese, Bulgarian, Estonian, Hebrew, Icelandic, Japanese, Kannada, Korean, Latvian, Nepali, Persian, Romanian, Sanskrit, Tamil, Thai, Turkish, Zulu...

Many languages are genetically and typologically unrelated

→ The Arabic WordNet extension was not successful, will be explained later.

Construct separate wordnets for each language

Contributors from each language encode the **same core** set of concepts **plus culture/language-specific** ones

Synsets (concepts) are mapped cross linguistically via an ontology instead of just the English Wordnet

Discussion

What would be a good database schema to store WordNet? Global WordNEt?

What is the difference between Synset and Concept?

How precise the Hyponymy? And what is the difference between to Hyponymy and subclass/subset?
