Chapter 4 Trees Splay Tree and B Tree

Splay Trees

- **Splay Tree** is binary search tree (BSTs) that:
 - Are not perfectly balanced all the time
 - It assumes that recently accessed nodes are most likely to visit them again.
 - Allow **search** and **insertion** operations to try to balance the tree so that **future operations may run faster**
- Based on the heuristic:
 - If X is accessed once, it is likely to be accessed again.
 - After node X is accessed, perform “**splaying**” operations to bring X up to the root of the tree.
 - Do this in a way that leaves the tree more or less balanced as a whole.

Motivating Example

- Not only splaying with 12 makes the tree **balanced**, subsequent accesses for 12 will take **$O(1)$** time.
- Active (recently accessed)** nodes will move towards the root and **inactive** nodes will slowly move further from the root

Splay Tree Terminology: operations

- Let X be a **non-root** node, i.e., has at least 1 ancestor.
- Let P be its **parent** node.
- Let G be its **grandparent** node (if it exists)
- Consider a path from **G to X**:
 - Each time we go **left**, we say that we “**zig**”
 - Each time we go **right**, we say that we “**zag**”
- There are 6 possible cases:

Splay Tree Operations

- When node X is accessed, apply one of **six** rotation operations:
 - **Single Rotations (X has a P but no G)**
 - zig, zag
 - **Double Rotations (X has both a P and a G)**
 - zig-zig, zig-zag
 - zag-zig, zag-zag

Splay Trees: Zig Operation

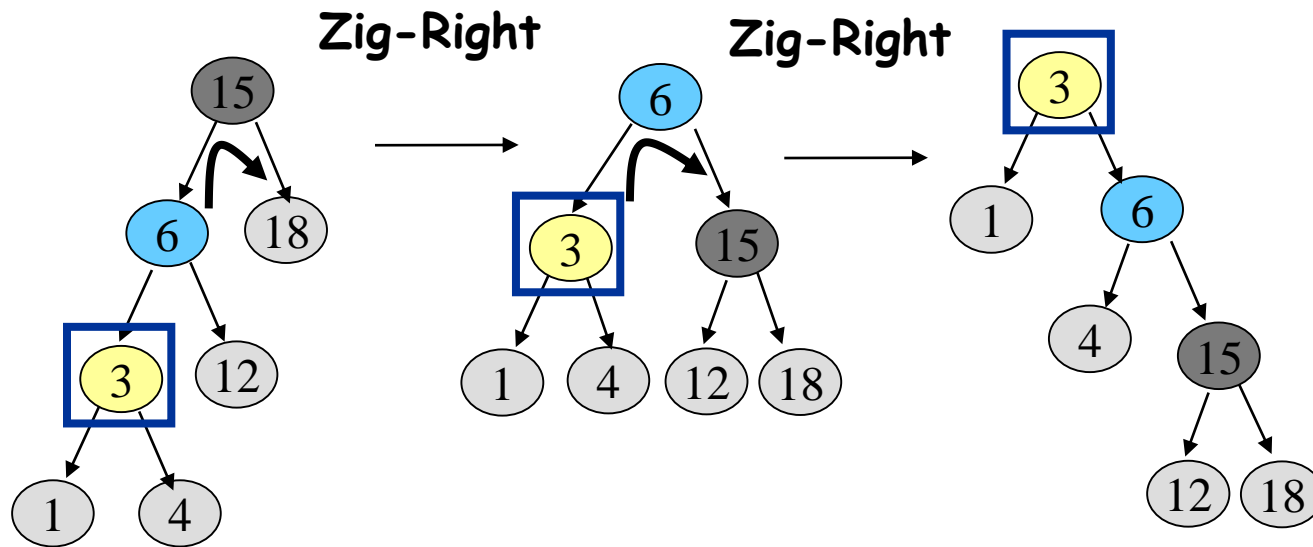

- “Zig” is just a **single rotation**, as in an AVL tree
- Suppose 6 was the node that was accessed (e.g. using Search)

- “Zig-Right” moves 6 to the root.
- Can access 6 faster next time: $O(1)$
- Notice that this is simply a **right rotation** in AVL tree terminology.

Splay Trees: Zig-Zig Operation

- “Zig-Zig” consists of **two single rotations of the same type**
- Suppose **3** was the node that was accessed (e.g., using Search)

- Due to “zig-zig” splaying, 3 has bubbled to the top!
- Note: **Parent-Grandparent** is rotated first.

Splay Trees: Zig-Zag Operation

- “Zig-Zag” consists of **two rotations of the opposite type**
- Suppose **12** was the node that was accessed (e.g., using Search)

- Due to “zig-zag” splaying, 12 has bubbled to the top!
- Notice that this is simply an **LR imbalance correction** in AVL tree terminology (first a left rotation, then a right rotation)

Splay Trees: Zag-Zig Operation

- “Zag-Zig” consists of **two rotations of the opposite type**
- Suppose **17** was the node that was accessed (e.g., using Search)

- Due to “zag-zig” splaying, 17 has bubbled to the top!
- Notice that this is simply an **RL imbalance correction** in AVL tree terminology (first a right rotation, then a left rotation)

Splay Trees: Zag-Zag Operation

- “Zag-Zag” consists of **two single rotations of the same type**
- Suppose **30** was the node that was accessed (e.g., using Search)

- Due to “zag-zag” splaying, 30 has bubbled to the top!
- Note: **Parent-Grandparent** is rotated first.

Splay Trees: Zag Operation

- “Zag” is just a **single rotation**, as in an AVL tree
- Suppose **15** was the node that was accessed (e.g., using Search)

- “Zag-Left” moves 15 to the root.
- Can access 15 faster next time: $O(1)$
- Notice that this is simply a **left rotation** in AVL tree terminology

Splay Trees:

Example – 40 is accessed

(a)

After Zig-zig

(b)

After Zig-zig

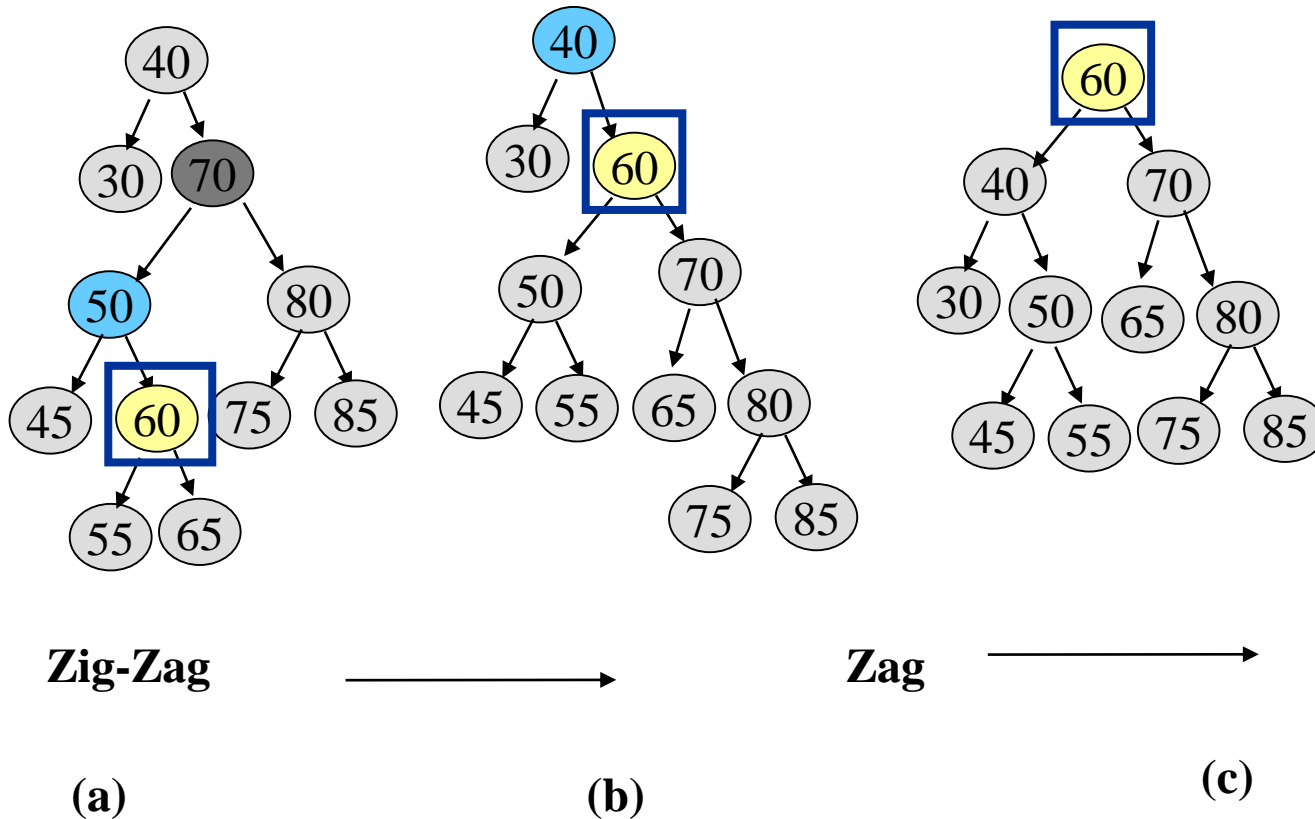

(c)

Splay Trees:

Example – 60 is accessed

Splaying during other operations

- Splaying can be done not just after Search, but also after other operations such as Insert/Delete.
- Insert X: After **inserting X** at a leaf node (as in a regular BST), **splay X up to the root**
- Delete X: Do a **Search on X and get X up to the root**. Delete X at the root and move the largest item in its left sub-tree, i.e, **its predecessor, to the root using splaying**.
- Note on Search X: If **X was not found**, splay the leaf node that the Search **ended up with to the root**.

Any **sequence** of **M** operations on a splay tree of size N takes **$O(M \log N)$** time.

Exercise: Do it by yourself

- Insert the keys 4,9,3,7,5,6 in that order into an empty splay tree.
 - A. Delete 9
 - B. Find 3
- Insert the keys 1, 2, ..., 7 in that order into an empty splay tree.

What happens when you access “7”?

Hint: ensure your solution by using this website

<https://www.cs.usfca.edu/~galles/visualization/SplayTree.html>

B-Trees

DEF: A B-Tree of order m is an m -way tree such that

1. All leaf nodes are at the same level.
2. All non-leaf nodes (except the root) have at most m and at least $m/2$ children.
3. The number of keys is one less than the number of children for non-leaf nodes and at most $m-1$ and at least $m/2$ for leaf nodes.
4. The root may have as few as 2 children unless the tree is the root alone.

Example for $m = 5$

DEF: A B-Tree of order 5 is an 5-way tree such that

1. All leaf nodes are at the same level.
2. All non-leaf nodes (except the root) have at most 5 and at least 2 children.
3. The number of keys is one less than the number of children for non-leaf nodes and at most 4 and at least 2 for leaf nodes.
4. The root may have as few as 2 children unless the tree is the root alone.

Creating a B-tree of order 5

- ① Start from the root $25 < 37$, go left.
 ② 25 is between 15 and 29, go to middle.
 ③ Insert 25 into node containing Key 22.

 We can **Split** this node to make room for the value that needs to be inserted.

 We can take the middle element from the overflowed node & bring it up to the correct place in the parent node.

* If the parent overflows, we can split again, all the way up to the root node.

Homework :

Insert the following elements

10,20,40,50,60,70,80,30,35,5,15,60

in a B-Tree of order $M=4$

Solution using

<https://www.cs.usfca.edu/~galles/visualization/BTree.html>

Homework :

Insert the following
elements 9,0,8,1,7,2,6,3,5,4,
in a B-Tree of order $M=3$,

Solution using

<https://www.cs.usfca.edu/~galles/visualization/BTree.html>
