

## Answers to Warm-Up Exercises

E9-1. Weighted average cost of capital

**Answer:**  $N = 10$ ,  $PV = \$20,000 (1 - 0.02) = \$19,600$ ,  $PMT = -0.08 \times \$20,000 = -\$1,600$ ,  $FV = -\$20,000$   
Solve for  $I = 8.30\%$

E9-2. Cost of preferred stock

**Answer:** The cost of preferred stock is the ratio of the preferred stock dividend to the firm's net proceeds from the sale of the preferred stock.

$$r_p = D_p \div N_p$$

$$r_p = (0.15 \times \$35) \div (\$35 - \$3)$$

$$r_p = \$5.25 \div \$32 = 16.4\%$$

E9-3. Cost of common stock equity

**Answer:** The cost of common stock equity can be found by dividing the dividend expected at the end of year 1 by the current price of the stock and adding the expected growth rate.

$$r_s = (D_1 \div P_0) + g$$

$$r_s = (\$6.50 \div \$78) + 7\% = 15.33\%$$

E9-4. Weighted average cost of capital

**Answer:**  $r_a = (0.35 \times 0.08) + (0.65 \times 0.13) = 0.0280 + 0.0845 = 11.25\%$

E9-5. Weighted average cost of capital

**Answer:**  $r_a = (0.55 \times 0.067) + (0.10 \times 0.092) + (0.35 \times 0.106) = 0.0832 = 8.32\%$

## Solutions to Problems

P9-1. Concept of cost of capital

### LG 1; Basic

- The firm is basing its decision on the cost to finance a particular project rather than the firm's combined cost of capital. This decision-making method may lead to erroneous accept/reject decisions.
- $r_a = w_d r_d + w_e r_e$   
 $r_a = 0.40 (7\%) + 0.60 (16\%)$   
 $r_a = 2.8\% + 9.6\%$   
 $r_a = 12.4\%$
- Reject project 263. Accept project 264.
- Opposite conclusions were drawn using the two decision criteria. The overall cost of capital as a criterion provides better decisions because it takes into consideration the long-run interrelationship of financing decisions.

P9-2. Cost of debt using both methods

### LG 3; Intermediate

- Net proceeds:  $N_d = \$1,010 - \$30$   
 $N_d = \$980$

b. Cash flows:

<i>T</i>	<i>CF</i>
0	\$ 980
1–15	–120
15	–1,000

c. Cost to maturity:

$$N = 15, P = 980, PMT = -120, FV = -1,000$$

Solve for I: 12.30%

$$\text{After-tax cost: } 12.30\% (1 - 0.4) = 7.38\%$$

d. Approximate before-tax cost of debt

$$r_d = \frac{\$120 + \frac{(\$1,000 - \$980)}{15}}{\frac{(\$980 + \$1,000)}{2}}$$

$$r_d = \$121.33 \div \$990,000$$

$$r_d = 12.26\%$$

$$\text{Approximate after-tax cost of debt} = 12.26\% \times (1 - 0.4) = 7.36\%$$

e. The advantages of the calculator method are evident. There are fewer keypunching strokes and one gets the actual cost of debt financing. However, the approximation formula is fairly accurate and expedient in the absence of a financial calculator.

P9-3. Before-tax cost of debt and after-tax cost of debt

**LG 3; Easy**

a.  $N = 10$ ,  $PV = -930$  (an expenditure),  $PMT = 0.6(1,000) = 60$ ,  $FV = 1,000$

Solving for I = 7.00%

b. Use the model: After-tax cost of debt = before-tax cost of debt  $\times$  (1 – tax bracket)

$$7.0\% (1 - 0.2) = 5.6\%$$

P9-4. Cost of debt using the approximation formula:

**LG 3; Basic**

$$r_d = \frac{I + \frac{\$1,000 - N_d}{n}}{\frac{N_d + \$1,000}{2}} \quad r_i = r_d \times (1 - T)$$

**Bond A**

$$r_d = \frac{\$90 + \frac{\$1,000 - \$955}{20}}{\frac{\$955 + \$1,000}{2}} = \frac{\$92.25}{\$977.50} = 9.44\%$$

$$r_i = 9.44\% \times (1 - 0.40) = 5.66\%$$

**Bond B**

$$r_d = \frac{\$100 + \frac{\$1,000 - \$970}{16}}{\frac{\$970 + \$1,000}{2}} = \frac{\$101.88}{\$985} = 10.34\%$$

$$r_i = 10.34\% \times (1 - 0.40) = 6.20\%$$

#### **Bond C**

$$r_d = \frac{\$120 + \frac{\$1,000 - \$955}{15}}{\frac{\$955 + \$1,000}{2}} = \frac{\$123}{\$977.50} = 12.58\%$$

$$r_i = 12.58\% \times (1 - 0.40) = 7.55\%$$

#### **Bond D**

$$r_d = \frac{\$90 + \frac{\$1,000 - \$985}{25}}{\frac{\$985 + \$1,000}{2}} = \frac{\$90.60}{\$992.50} = 9.13\%$$

$$r_i = 9.13\% \times (1 - 0.40) = 5.48\%$$

#### **Bond E**

$$r_d = \frac{\$110 + \frac{\$1,000 - \$920}{22}}{\frac{\$920 + \$1,000}{2}} = \frac{\$113.64}{\$960} = 11.84\%$$

$$r_i = 11.84\% \times (1 - 0.40) = 7.10\%$$

P9-5. Cost of debt using the approximation formula

#### **LG 3; Intermediate**

$$r_d = \frac{I + \frac{\$1,000 - N_d}{n}}{\frac{N_d + \$1,000}{2}} \quad r_i = r_d \times (1 - T)$$

#### **Alternative A**

$$r_d = \frac{\$90 + \frac{\$1,000 - \$1,220}{16}}{\frac{\$1,220 + \$1,000}{2}} = \frac{\$76.25}{\$1,110} = 6.87\%$$

$$r_i = 6.87\% \times (1 - 0.40) = 4.12\%$$

Calculator: N = 16, PV = \$1,220, PMT = -\$90, FV = -\$1,000

Solve for I: 6.71%

After-tax cost of debt: 4.03%

#### **Alternative B**

$$r_d = \frac{\$70 + \frac{\$1,000 - \$1,020}{5}}{\frac{\$1,020 + \$1,000}{2}} = \frac{\$66.00}{\$1,010} = 6.54\%$$

$$r_i = 6.54\% \times (1 - 0.40) = 3.92\%$$

Calculator: N = 5, PV = \$1,020, PMT = -\$70, FV = -\$1,000

Solve for I: 6.52%

After-tax cost of debt: 3.91%

#### Alternative C

$$r_d = \frac{\$60 + \frac{\$1,000 - \$970}{7}}{\frac{\$970 + \$1,000}{2}} = \frac{\$64.29}{\$985} = 6.53\%$$

$$r_i = 6.53\% \times (1 - 0.40) = 3.92\%$$

Calculator: N = 7, PV = \$970, PMT = -\$60, FV = -\$1,000

Solve for I: 6.55%

After-tax cost of debt: 3.93%

#### Alternative D

$$r_d = \frac{\$50 + \frac{\$1,000 - \$895}{10}}{\frac{\$895 + \$1,000}{2}} = \frac{\$60.50}{\$947.50} = 6.39\%$$

$$r_i = 6.39\% \times (1 - 0.40) = 3.83\%$$

Calculator: N = 10, PV = \$895, PMT = -\$50, FV = -\$1,000

Solve for I: 6.46%

After-tax cost of debt: 3.87%

P9-6. After-tax cost of debt

#### LG 3; Intermediate

- Since the interest on the boat loan is not tax deductible, its after-tax cost equals its stated cost of 8%.
- Since the interest on the second mortgage is tax deductible, its after-tax cost is found by multiplying the before-tax cost of debt by  $(1 - \text{tax rate})$ . Being in the 28% tax bracket, the after-tax cost of debt is  $6.6\% = 9.2\% \times (1 - 0.28)$ .
- Home equity loan has a lower after-tax cost. However, using the second home mortgage does put the Starks at risk of losing their home if they are unable to make the mortgage payments.

P9-7. Cost of preferred stock:  $r_p = D_p \div N_p$

#### LG 2; Basic

$$a. \quad r_p = \frac{\$12.00}{\$95.00} = 12.63\%$$

$$b. \quad r_p = \frac{\$10.00}{\$90.00} = 11.11\%$$

P9-8. Cost of preferred stock:  $r_p = D_p \div N_p$

**LG 4; Basic**

Preferred Stock	Calculation
A	$r_p = \$11.00 \div \$92.00 = 11.96\%$
B	$r_p = 3.20 \div 34.50 = 9.28\%$
C	$r_p = 5.00 \div 33.00 = 15.15\%$
D	$r_p = 3.00 \div 24.50 = 12.24\%$
E	$r_p = 1.80 \div 17.50 = 10.29\%$

P9-9. Cost of common stock equity—capital asset pricing model (CAPM)

**LG 5; Intermediate**

$$r_s = R_F + [b \times (r_m - R_F)]$$

$$r_s = 6\% + 1.2 \times (11\% - 6\%)$$

$$r_s = 6\% + 6\%$$

$$r_s = 12\%$$

a. Risk premium = 6%

b. Rate of return = 12%

c. After-tax cost of common equity using the CAPM = 12%

P9-10. Cost of common stock equity:  $k_n = \frac{D_1 + g}{N_n}$

**LG 5; Intermediate**

a.  $N = 4$  (2012 – 2008), PV (initial value) =  $-\$2.12$ , FV (terminal value) =  $\$3.10$

Solve for I (growth rate): 9.97%

b.  $N_n = \$52$  (given in the problem)

c.  $r_r = (\text{Next Dividend} \div \text{Current Price}) + \text{growth rate}$

$$r_r = (\$3.40 \div \$57.50) + 0.0997$$

$$r_r = 0.0591 + 0.0997 = 0.1588 \text{ or } 15.88\%$$

d.  $r_r = (\$3.40 \div \$52) + 0.0997$

$$r_r = 0.0654 + 0.0997 = 0.1651 \text{ or } 16.51\%$$

P9-11. Retained earnings versus new common stock

**LG 5; Intermediate**

$$r_r = \frac{D_1}{P_0} + g$$

$$r_n = \frac{D_1}{N_n} + g$$

Firm	Calculation
A	$r_r = (\$2.25 \div \$50.00) + 8\% = 12.50\%$ $r_n = (\$2.25 \div \$47.00) + 8\% = 12.79\%$
B	$r_r = (\$1.00 \div \$20.00) + 4\% = 9.00\%$ $r_n = (\$1.00 \div \$18.00) + 4\% = 9.56\%$
C	$r_r = (\$2.00 \div \$42.50) + 6\% = 10.71\%$

	$r_n = (\$2.00 \div \$39.50) + 6\% = 11.06\%$
D	$r_r = (\$2.10 \div \$19.00) + 2\% = 13.05\%$
	$r_n = (\$2.10 \div \$16.00) + 2\% = 15.13\%$

P9-12. Effect of tax rate on WACC

**LG 3, 4, 5, 6; Intermediate**

- WACC = (0.30)(11%)(1 - 0.40) + (0.10)(9%) + (0.60)(14%)  
WACC = 1.98% + 0.9% + 8.4%  
WACC = 11.28%
- WACC = (0.30)(11%)(1 - 0.35) + (0.10)(9%) + (0.60)(14%)  
WACC = 2.15% + 0.9% + 8.4%  
WACC = 11.45%
- WACC = (0.30)(11%)(1 - 0.25) + (0.10)(9%) + (0.60)(14%)  
WACC = 2.48% + 0.9% + 8.4%  
WACC = 11.78%
- As the tax rate decreases, the WACC increases due to the reduced tax shield from the tax-deductible interest on debt.

P9-13. WACC—book values

**LG 6; Basic**

a.

Type of Capital	Book Value	Weight	Cost	Weighted Cost
L-T debt	\$700,000	0.500	5.3%	2.650%
Preferred stock	50,000	0.036	12.0%	0.432%
Common stock	650,000	0.464	16.0%	7.424%
	<u>\$1,400,000</u>	<u>1.000</u>		<u>10.506%</u>

- The WACC is the rate of return that the firm must receive on long-term projects to maintain the value of the firm. The cost of capital can be compared to the return for a project to determine whether the project is acceptable.

P9-14. WACC—book weights and market weights

**LG 6; Intermediate**

a. Book value weights:

Type of Capital	Book Value	Weight	Cost	Weighted Cost
L-T debt	\$4,000,000	0.784	6.00%	4.704%
Preferred stock	40,000	0.008	13.00%	0.104%
Common stock	1,060,000	0.208	17.00%	3.536%
	<u>\$5,100,000</u>			<u>8.344%</u>

- b. Market value weights:

Type of Capital	Market Value	Weight	Cost	Weighted Cost
L-T debt	\$3,840,000	0.557	6.00%	3.342%
Preferred stock	60,000	0.009	13.00%	0.117%
Common stock	<u>3,000,000</u>	0.435	17.00%	<u>7.395%</u>
	\$6,900,000			10.854%

- c. The difference lies in the two different value bases. The market value approach yields the better value since the costs of the components of the capital structure are calculated using the prevailing market prices. Since the common stock is selling at a higher value than its book value, the cost of capital is much higher when using the market value weights. Notice that the book value weights give the firm a much greater leverage position than when the market value weights are used.

P9-15. WACC and target weights

**LG 6; Intermediate**

- a. Historical market weights:

Type of Capital	Weight	Cost	Weighted Cost
L-T debt	0.25	7.20%	1.80%
Preferred stock	0.10	13.50%	1.35%
Common stock	0.65	16.00%	<u>10.40%</u>
			13.55%

- b. Target market weights:

Type of Capital	Weight	Cost	Weighted Cost
L-T debt	0.30	7.20%	2.160%
Preferred stock	0.15	13.50%	2.025%
Common stock	0.55	16.00%	<u>8.800%</u>
			12.985%

- c. Using the historical weights the firm has a higher cost of capital due to the weighting of the more expensive common stock component (0.65) versus the target weight of (0.55). This over-weighting in common stock leads to a smaller proportion of financing coming from the significantly less expensive long-term debt and the lower-costing preferred stock.

P9-16. Cost of capital

**LG 3, 4, 5, 6; Challenge**

- a. Cost of retained earnings

$$r_r = \frac{\$1.26(1+0.06)}{\$40.00} + 0.06 = \frac{\$1.34}{\$40.00} = 3.35\% + 6\% = 9.35\%$$

- b. Cost of new common stock

$$r_s = \frac{\$1.26(1 + 0.06)}{\$40.00 - \$7.00} + 0.06 = \frac{\$1.34}{\$33.00} = 4.06\% + 6\% = 10.06\%$$

- c. Cost of preferred stock

$$r_p = \frac{\$2.00}{\$25.00 - \$3.00} = \frac{\$2.00}{\$22.00} = 9.09\%$$

$$d. \quad r_d = \frac{\$100 + \frac{\$1,000 - \$1,175}{5}}{\frac{\$1,175 + \$1,000}{2}} = \frac{\$65.00}{\$1,087.50} = 5.98\%$$

$$r_i = 5.98\% \times (1 - 0.40) = 3.59\%$$

e.  $WACC = (0.40)(3.59\%) + (0.10)(9.09\%) + (0.50)(9.35\%)$   
 $WACC = 1.436 + 0.909 + 4.675$   
 $WACC = 7.02\%$

P9-17. Calculation of individual costs, WACC, and WMCC

**LG 3, 4, 5, 6; Challenge**

- a. After-tax cost of debt

*Approximate Approach*

$$r_d = \frac{I + \frac{(\$1,000 - N_d)}{n}}{\frac{(N_d + \$1,000)}{2}}$$

$$r_d = \frac{\$100 + \frac{(\$1,000 - \$950)}{10}}{\frac{(\$950 + \$1,000)}{2}} = \frac{\$100 + \$5}{\$975} = 10.77\%$$

$$r_i = 10.77 \times (1 - 0.40)$$

$$r_i = 6.46\%$$

*Calculator approach*

$$N = 10, PV = \$950, PMT = -\$100, FV = -\$1,000$$

Solve for I: 10.84%

$$\text{After-tax cost of debt: } 10.84 (1 - 0.40) = 6.51\%$$

- b. Cost of preferred stock:  $r_p = \frac{D_p}{N_p}$

$$r_p = \frac{\$8}{\$63} = 12.70\%$$

- c. Cost of new common stock equity:

Solve for g:

$$N = 4, PV = -\$2.85, FV = \$3.75$$

Solve for I: 7.10%

Net Proceeds: Current price – Price adjustment – Floatation cost

$$\$50 - \$5 - \$3 = \$42$$

$$r_n = \$4.00 \div \$42.00 + 0.0710 = 0.0952 + 0.0710 = 0.1662 = 16.62\%$$

- d. WACC:
- |                 |                       |   |        |
|-----------------|-----------------------|---|--------|
| L-T debt        | $0.40 \times 6.51\%$  | = | 2.60%  |
| Preferred stock | $0.10 \times 12.70\%$ | = | 1.27%  |
| Common stock    | $0.50 \times 16.62\%$ | = | 8.31%  |
| WACC            |                       | = | 12.18% |

- P9-18. Weighted-average cost of capital

**LG 6; Intermediate**

	Rate [1]	Outstanding Loan Balance [2]	Weight [2] ÷ 64,000 = [3]	WACC [1] × [3]
Loan 1	6.00%	\$ 20,000	31.25%	1.88%
Loan 2	9.00%	\$12,000	18.75%	1.69%
Loan 3	5.00%	<u>\$32,000</u>	50.00%	<u>2.50%</u>
Total		\$64,000		6.06%

John Dough should not consolidate his college loans because their weighted cost is less than the 7.2% offered by his bank.

- P9-19. Calculation of individual costs and WACC

**LG 3, 4, 5, 6; Challenge**

- a. After-tax cost of debt

*Approximate approach*

$$r_d = \frac{I + \frac{(\$1,000 - N_d)}{n}}{\frac{(N_d + \$1,000)}{2}}$$

$$r_d = \frac{\$80 + \frac{(\$1,000 - \$940)}{20}}{\frac{(\$940 + \$1,000)}{2}} = \frac{\$80 + \$3}{\$970} = 8.56\%$$

$$r_i = r_d \times (1 - t)$$

$$r_i = 8.56\% \times (1 - 0.40)$$

$$r_i = 5.14\%$$

*Calculator approach*

$$N = 20, PV = \$940, PMT = -\$80, FV = -\$1,000$$

Solve for I: 8.64%

$$\text{After-tax cost of debt: } 8.64\% (1 - 0.40) = 5.18\%$$

b. Preferred stock:

$$r_p = \frac{D_p}{N_p}$$

$$r_p = \frac{\$7.60}{\$90} = 8.44\%$$

c. Retained earnings:

$$r_r = \frac{D_1}{P_0} + g$$

$$= (\$7.00 \div \$90) + 0.06 = 0.0778 + 0.0600 = 0.1378 \text{ or } 13.78\%$$

New common stock:

$$r_n = \frac{D_1}{N_n} + g$$

$$= [\$7.00 \div (\$90 - \$7 - \$5)] + 0.06$$

$$= [\$7.00 \div \$78] + 0.06 = 0.0897 + 0.0600 = 0.1497 \text{ or } 14.97\%$$

Type of Capital	Target Capital Structure %	Cost of Capital Source	Weighted Cost
2. With retained earnings			
Long-term debt	0.30	5.18%	1.55%
Preferred stock	0.20	8.44%	1.69%
Common stock equity	0.50	13.78%	6.89%
			WACC = 10.13%
3. With new common stock			
Long-term debt	0.30	5.18%	1.55%
Preferred stock	0.20	8.44%	1.69%
Common stock equity	0.50	14.97%	7.48%
			WACC = 10.72%

P9-20. Weighted-average cost of capital

**LG 6; Intermediate**

- WACC = 0.50 (0.06) + 0.50 (0.12) = 0.03 + 0.06 = 0.09 or 9.0%
- WACC = 0.70 (0.06) + 0.30 (0.12) = 0.042 + 0.036 = 0.078 or 7.8%
- They are affected, because under the revised capital structure there is more debt financing. Bond holders represent a prior, legal claim to the firm's operating income. A larger interest expense must be paid prior to any dividend payment. There is also a greater chance of bankruptcy, because the firm's operating income may be insufficiently large to accommodate the larger interest expense.
- WACC = 0.70 (0.06) + 0.30 (0.16) = 0.042 + 0.048 = 0.09, or 9%
- Increasing the percentage of debt financing increases the risk of the company not being able to make its interest payments. Bankruptcy would have negative consequences to both bondholders and stockholders. As shown in part d, if stockholders increase their required rate of return, the cost of capital may not decline. In fact, if the bondholders required a higher return also, the cost of capital would actually rise in this scenario.

P9-21. Ethics problem

**LG 1; Intermediate**

GE's long string of good earnings reports made the company seem less risky, so its cost of capital would be lower (e.g., the AAA credit rating mentioned in the chapter opener is evidence of

this). If investors learn that GE is really more risky than it seems, then the cost of capital will go up and GE's value will fall.
