

Faculty of Engineering and Tecnology Computer Science Department

Relational Model

Chapter 3

- Entities, relationships, attributes
- Cardinalities: 1:1, 1:n, m:1, m:n
- Keys: superkeys, candidate keys, primary keys

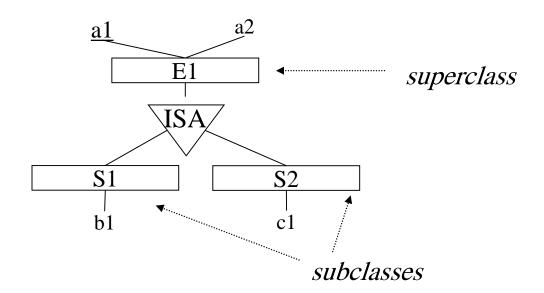

- Weak Entity sets, identifying relationship
- Discriminator, total participation, one-to-many

Generalization-specialization

- Data models: framework for organizing and interpreting data
- E/R Model
- OO, Object relational, XML
- Relational Model
 - Intro
 - E/R to relational
 - SQL preview

Relational Data Model

- Introduced by Ted Codd (early 70') (Turing Award, '81)
- Relational data model contributes:
 - 1. Separation of logical and physical data models (data independence)
 - Declarative query languages
 - 3. Formal semantics
 - 4. Query optimization (key to commercial success)

Relations

account =

bname	acct_no	balance
Downtown	A-101	500
Brighton	A-202	450
Brookline	A312	600

Rows (tuples, records)
Columns (attributes)
Tables (relations)

Why relations?

Relations

Mathematical relations (from set theory):

```
Given 2 sets R={ 1, 2, 3, 5}, S={3, 4}
```

- R x S = $\{(1,3), (1,4), (2,3), (2,4), (3,3), (3,4), (5,3), (5,4)\}$
- A relation between R and S is any subset of R x S
 e.g., {(1,3), (2,4), 5,3)}
- Database relations:

Given attribute domains:

```
bname = {Downtown, Brighton, ....}
acct_no = { A-101, A-102, A-203, ...}
balance = { ..., 400, 500, ...}
```

account subset of bname x acct_no x balance

{ (Downtown, A-101, 500), (Brighton, A-202, 450), (Brookline, A-312, 600)}

Storing Data in a Table

sid	name	major	age	gpa
53666	Duaa	CE	18	3.4
53688	Ali	CE	18	3.2
53650	Mohammad	CS	19	3.8

- Data about individual students
- One row per student
- How to represent course enrollment?

Storing More Data in Tables

- Students may enroll in more that one course
- Most efficient: keep enrollment in separate table

Enrolled

cid	grade	sid
Carnatic101	C	53666
Reggae203	В	53666
Topology112	Α	53650
History105	В	53666

Linking Data from Multiple Tables

- How to connect student data to enrollment?
- Need a Key

Enrolled

cid	grade	sid	
Carnatic101	C	53666	
Reggae203	В	53666	7
Topology112	A	53650	
History105	В	53666	

Students

	sid	name	login	age	gpa
<u> </u>	53666	Jones	jones@cs	18	3.4
	53688	Smith	smith@eecs	18	3.2
	53650	Smith	smith@math	19	3.8
			I I		

Relational Data Model: Formal Definitions

- □ Relational database: a set of relations.
 □ Relation: made up of 2 parts:
 □ Instance: a table, with rows and columns.
 #rows = cardinality
 □ Schema: specifies name of relation, plus name and type of each column.
 E.g. Students(sid: string, name: string, login: string, age: integer, gpa: real)
 - #fields = degree / arity
- \square Can think of a relation as a *set* of rows or *tuples*.
 - ☐ i.e., all rows are distinct

In other words...

- Data Model a way to organize information
- Schema one particular organization,
 - i.e., a set of fields/columns, each of a given type
- Relation
 - a name
 - a schema
 - a set of tuples/rows, each following organization specified in schema

Example Instance of Students Relation

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

Cardinality = 3, arity (degree) = 5, all rows distinct

SQL - A language for Relational DBs

- SQL: Structured Query language
 - Data Definition Language (DDL)
 - create, modify, delete relations
 - specify constraints
 - administer users, security, etc.
 - Data Manipulation Language (DML)
 - Specify queries to find tuples that satisfy criteria
 - add, modify, remove tuples

SQL Overview

```
    CREATE TABLE <name> ( <field> <domain>, ... )

    INSERT INTO <name> (<field names>)

       VALUES (<field values>)

    DELETE FROM <name>

        WHERE <condition>
UPDATE <name>
     SET <field name> = <value>
   WHERE <condition>

    SELECT <fields>

    FROM <name>
   WHERE <condition>
```

Creating Relations in SQL

- Creates the Students relation.
- Note: the type (domain) of each field is specified, and enforced by the DBMS
 whenever tuples are added or modified.
- Another example: the Enrolled table holds information about courses students take.

sname grade cname No.Hrs

Student Enroll Course

CREATE TABLE Students
(sid CHAR(9),
name CHAR(20),
major CHAR(10),
age INTEGER,
gpa REAL)

CREATE TABLE Enrolled (sid CHAR(20), cid CHAR(20), grade CHAR(2))

Adding and Deleting Tuples

☐ Can insert a single tuple using:

```
INSERT INTO Students (sid, name, major, age, gpa) VALUES ('53688', 'Alaa', 'CE', 18, 83.4)
```

Can delete all tuples satisfying some condition (e.g., name = Smith):

FROM Students S
WHERE S.name = 'Ali'

□ Powerful variants of these commands are available; more later!

- Integrity Constraints (IC): conditions that restrict the data that can be stored in the database
- Keys are a way to associate tuples in different relations
- Keys are one form of integrity constraint (IC)

Enrolled

cid	grade	sid	
Carnatic101	C	53666	
Reggae203	В	53666	
Topology112	Α	53650	
History105	В	53666	

Students

	sid	name	login	age	gpa
	53666	Jones	jones@cs	18	3.4
	53688	Smith	smith@eecs	18	3.2
_	53650	Smith	smith@math	19	3.8

Primary Keys - Definitions

Key: A minimal set of attributes that uniquely identify a tuple
A set of fields is a <u>superkey</u> if: No two distinct tuples can have same values in all key fields
A set of fields is a <u>candidate key</u> for a relation if: It is a superkey No subset of the fields is a superkey
>1 <u>candidate keys</u> for a relation? one of the keys is chosen (by DBA) to be the <i>primary key</i> .
 E.g. □ sid is a key for Students. □ What about name? □ The set {sid, gpa} is a superkey.

Primary and Candidate Keys In SQL

- □ Possibly many <u>candidate keys</u> (specified using UNIQUE), one of which is chosen as the <u>primary key</u>.
- "For a given student and course, there is a single grade."
- VS.
- "Students can take only one course, and receive a single grade for that course; further, no two students in a course receive the same grade."

```
CREATE TABLE Enrolled
(sid CHAR(20)
cid CHAR(20),
grade integer,
PRIMARY KEY (sid,cid))
```

```
CREATE TABLE Enrolled
  (sid CHAR(20)
    cid CHAR(20),
    grade integer,
    PRIMARY KEY (sid),
    UNIQUE (cid, grade))
```

Foreign Keys

 A Foreign Key is a field whose values are keys in another relation.

Enrolled

cid	grade	sid	
Carnatic101		53666	
Reggae203	В	53666	
Topology112		53650	
History105	В	53666	

Students

	sid	name	login	age	gpa
-	53666	Jones	jones@cs	18	3.4
	53688	Smith	smith@eecs	18	3.2
	53650	Smith	smith@math	19	3.8

Foreign Keys, Referential Integrity

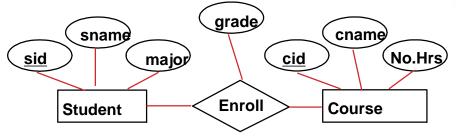

- <u>Foreign key</u>: Set of fields in one relation used to `refer' to tuples in another relation.
 - Must correspond to primary key of the second relation.
 - Like a `logical pointer'.
- E.g. sid in Enrolled is a foreign key referring to Students:
 - Enrolled(sid: string, cid: string, grade: string)
 - If all foreign key constraints are enforced, <u>referential integrity</u> is achieved (i.e., no dangling references.)

Foreign Keys in SQL

Only students listed in the Students relation should be allowed to enrol

for courses.

CREATE TABLE Enrolled

(sid CHAR(20), cid CHAR(20), grade integer,

PRIMARY KEY (sid, cid),

FOREIGN KEY (sid) REFERENCES Students,

FOREIGN KEY (cid) REFERENCES Course)

Enrolled

sid	cid	grade	_
53666	Carnatic101	C	
53666	Reggae203	В -	7
53650	Topology112	Α _	
53666	History105	В /	

Students

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

Integrity Constraints (ICs)

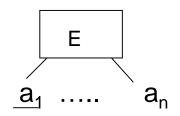

- > IC: condition that must be true for any instance of the database;
 - e.g., <u>domain constraints.</u>
 - ICs are specified when schema is defined.
 - ICs are checked when relations are modified.
- > A *legal* instance of a relation is one that satisfies all specified ICs.
 - DBMS should not allow illegal instances.
- ➤ If the DBMS checks ICs, stored data is more faithful to real-world meaning.
 - Avoids data entry errors, too!

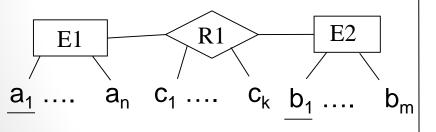

E/R to Relations

E/R diagram

Relational schema, e.g. account=(bname, acct_no, bal)

$$E = (a_1, ..., a_n)$$

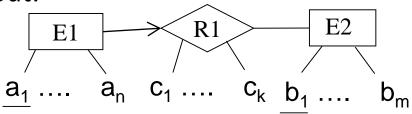

R1=
$$(\underline{a_1}, \underline{b_1}, c_1, ..., c_k)$$

More on relationships

What about:

R1=
$$(\underline{a}_1, b_1, c_1, ..., c_k)$$

Could have :

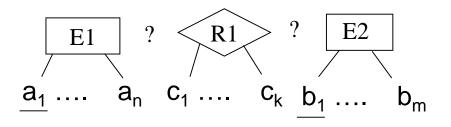

since a_1 is the key for R1 (also for E1=(\underline{a}_1 ,, a_n))

- Another option is to merge E1 and R1
 - ignore R1
 - Add b1, c1,, ck to E1 instead, i.e.

Any problem?

• E1= $(\underline{a_1},, a_n, b_1, c_1, ..., c_k)$

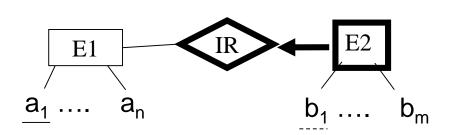

- $R1$	E1 = $(\underline{a}_{\underline{1}},, a_{n})$ E2 = $(\underline{b}_{\underline{1}},, b_{m})$ R1 = $(\underline{a}_{\underline{1}}, \underline{b}_{\underline{1}}, c_{1}, c_{k})$
\rightarrow R1	E1 = $(\underline{a_1},, a_n, b_1, c_1,, c_k)$ E2 = $(\underline{b_1},, b_m)$
R1	E1 = $(\underline{a}_1,, a_n)$ E2 = $(\underline{b}_1,, b_m, a_1, c_1,, c_k)$
\rightarrow R1	Treat as n:1 or 1:m

E/R to Relational

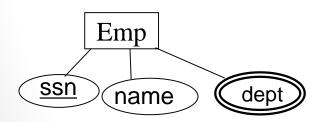

Weak entity sets

$$E1 = (\underline{a}_1, ..., a_n)$$

$$E2 = (\underline{a_1}, \underline{b_1}, ..., \underline{b_m})$$

Multivalued Attributes

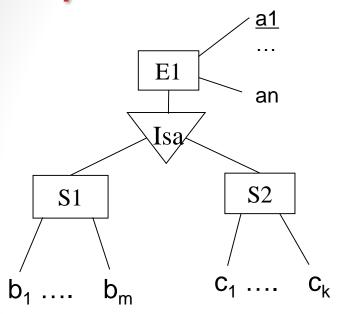

$$Emp = (\underline{ssn}, name)$$

 $Emp-Dept = (\underline{ssn}, dept)$

E/R to Relational

Method 1:
$$E = (\underline{a}_1, ..., a_n)$$

 $S1 = (\underline{a}_1, b_1, ..., b_m)$
 $S2 = (\underline{a}_1, c_1 ..., c_k)$

Method 2:

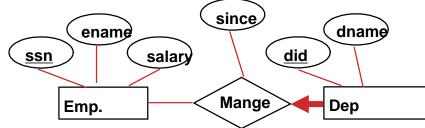

S1 =
$$(\underline{a}_1,..., a_n, b_1, ..., b_m)$$

S2 = $(\underline{a}_1, ..., a_n, c_1 ..., c_k)$

Q: When is method 2 not possible?

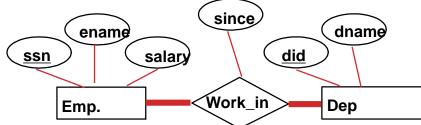

Relationships with Participation constraint

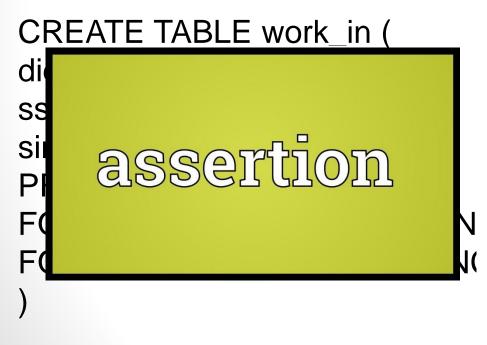

CREATE TABLE Dep_Manage (did INTEGER, dname CHAR(20) , ssn CHAR(11) NOT NULL, since DATE, PRIMARY KEY (did), FOREIGN KEY (ssn) REFERENCES Employees ON DELETE NO ACTION)

Relationships with Participation constraint

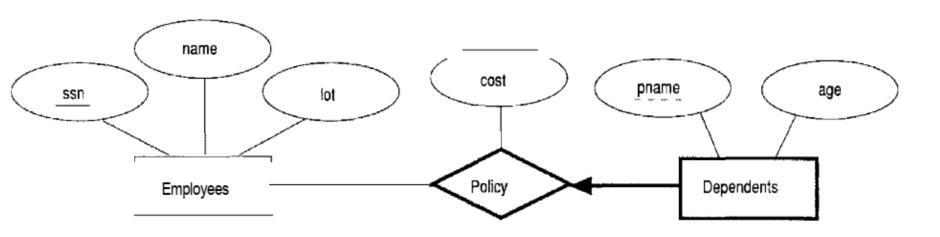

```
CREATE TABLE Reports_To (
supervisor...ssn CHAR(11),
subordinate...ssn CHAR(11),
PRIMARY KEY (supervisor.ssn, subordinate_ssn),
FOREIGN KEY (supervisor...ssn) REFERENCES Employees(ssn),
FOREIGN KEY (subordinate...ssn) REFERENCES Employees(ssn))
```

Weak entity

```
CREATE TABLE Dep_Policy (pname CHAR(20),
age INTEGER,
cost REAL,
ssn CHAR(11),
PRIMARY KEY (pname, ssn),
FOREIGN KEY (ssn) REFERENCES Employees
ON DELETE CASCADE)
```

Translate the following ER to RM using create table statements
