Fixed point iteration

To solve $f(x)=0$ we solve $x=g(x)$ [where $f(x)=x-g(x)$]
↓
[Fixed point]

i.e. to Find the roots of $F \rightarrow$ we Find the Fixed point of $g(x)$.

Def:- p is a fixed point of g iff $g(p)=p$.

1. $g(x) = \frac{1}{x}$

Fixed points $1, -1$.

$$g(p) = p$$

$$\frac{1}{p} = p \Rightarrow p^2 = 1 \Rightarrow p = \pm 1$$

2. $g(x) = x+1$. No Fixed points

3. $g(x) = x$. all points are Fixed points.

Def:- Fixed point iteration:-

start with P_0 , $P_{n+1} = g(P_n)$, $n=0, 1, 2, 3, \dots$

$$P_1 = g(P_0)$$

$$P_2 = g(P_1)$$

⋮

Theorem:-

if the Fixed point iteration converges to P , then P is the Fixed point of g .

$$\lim_{n \rightarrow \infty} P_n = P \Rightarrow \lim_{n \rightarrow \infty} P_{n+1} = \lim_{n \rightarrow \infty} g(P_n) = g(\lim_{n \rightarrow \infty} P_n) = g(P)$$

since $P_{n+1} = g(P_n) \downarrow = P$.

example:-

Solve $x^2 - 2x - 3 = 0 \Rightarrow f(x) = 0$.

$$(x-3)(x+1) = 0.$$

$$x = 3.$$

$$x = -1.$$

$$x^2 = 2x + 3.$$

$$x = \sqrt{2x+3} = g(x).$$

$$P_2 = g(P_1) = g(3.31662) = \sqrt{9.63325} = 3.10375$$

$$P_3 = 3.03439$$

$$P_4 = 3.01184$$

$$P_n \rightarrow 3$$

Note that 3 is a fixed point of

$$P_0 = 4$$

$$P_1 = g(4) = 6.5$$

$$P_2 = g(6.5) = 19.625.$$

$$P_3 = 191.07$$

$$x(x-2) = 3 \Rightarrow x = \frac{3}{x-2} = g(x).$$

$$P_0 = 4$$

$$P_1 = g(4) = \frac{3}{2} = 1.5.$$

$$P_2 = -6$$

$$P_3 = -0.375$$

$$P_4 = -1.26315.$$

$$P_5 = -0.919355$$

$$P_6 = -1.02762$$

P is a root of multiplicity M of $f(x)$ if $f(x) = (x-P)^M h(x)$, $h(P) \neq 0$.

- $f(x) = x^3 - 3x + 2$

1 is a root of $f(x)$

what is the multiplicity of 1?

$$\begin{array}{r} x^2 + x - 2 \\ x-1 \overline{) x^3 - 3x + 2} \\ \underline{-x^3 + x^2} \\ x^2 - 3x + 2 \\ \underline{-x^2 + x} \\ -2x + 2 \\ \underline{+2x - 2} \\ 0 \end{array}$$

$$f(x) = (x-1)(x^2 + x - 2)$$

1 has multiplicity 2 (quadratic root) $M=2$
-2 is a simple root ($M=1$)

P is a root of multiplicity M of $f(x)$ iff

$$f(P)=0, f'(P)=0, \dots, f^{(M-1)}(P)=0 \text{ but}$$

$$f(x) = x^3 - 3x + 2$$

$$f(1) = 0$$

$$f'(x) = 3x^2 - 3$$

$$f'(1) = 0$$

$$f''(x) = 6x$$

$$\text{if } e_{n+1} \approx A e_n^2$$

$$\lim_{n \rightarrow \infty} \frac{e_{n+1}}{e_n^2} \approx A \rightarrow \text{quadratic convergence.}$$

Definition:- Order of Convergence

assume $p_n \rightarrow p$ and $e_n = p - p_n$, if there exists two positive numbers A, R such that

$$\lim_{n \rightarrow \infty} \frac{|e_{n+1}|}{|e_n|^R} = A$$

Then the sequence is said to converge to p with order of convergence R , A is called the Asymptotic error constant.

if $R=1$, we call it linear convergence.

if $R=2$, we call it quadratic convergence.

example:-

show that $p_n = \frac{1}{n^3}$ converges to $\downarrow p$ 0 linearly??

$$\begin{aligned} \lim_{n \rightarrow \infty} \frac{|e_{n+1}|}{|e_n|} &= \lim_{n \rightarrow \infty} \frac{|0 - \frac{1}{(n+1)^3}|}{|0 - \frac{1}{n^3}|} = \lim_{n \rightarrow \infty} \frac{\frac{1}{(n+1)^3}}{\frac{1}{n^3}} = \lim_{n \rightarrow \infty} \frac{n^3}{(n+1)^3} \\ &= \left(\lim_{n \rightarrow \infty} \frac{n}{n+1} \right)^3 = 1 \end{aligned}$$

$\frac{1}{n^3} \xrightarrow{\downarrow} 0$ linearly

$$f(x) = x^{101} - x^{100} - x + 1$$

$$f(1) = 0$$

$$f'(x) = 101x^{100} - 100x^{99} - 1$$

$$f'(1) = 101 - 100 - 1 = 0$$

$$f''(x) = (101)(100)x^{99} - (100)(99)x^{98}$$

$$f''(1) \neq 0$$

Solve using Newton method.

- inverse method.

$$x^2 - 2x - y = 0.5 \rightarrow P_n: x^2 - 2x - y - 0.5 = 0 = f_1(x, y)$$

$$x^2 + 4y^2 = 4 \rightarrow x^2 + 4y^2 - 4 = 0 = f_2(x, y)$$

$$f_1(2, 0.25) = 0.25$$

$$f_2(2, 0.25) = 0.25$$

$$= \begin{pmatrix} 2 \\ 0.25 \end{pmatrix} - \frac{1}{8} \begin{bmatrix} 2 & 1 \\ -4 & 2 \end{bmatrix} \begin{pmatrix} 0.25 \\ 0.25 \end{pmatrix} = \begin{pmatrix} 1.90625 \\ 0.3125 \end{pmatrix}$$

$$\Delta y = \frac{\begin{vmatrix} -0.25 & 2 \\ -0.25 & 4 \end{vmatrix}}{8} = \frac{-0.5+1}{8} = \frac{0.5}{8} = 0.0625$$
