Chapter 9 Objects and Classes

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

OO Programming Concepts

Object-oriented programming (OOP) involves programming using objects. **An object represents an entity in the real world that can be distinctly identified.** For example, a student, a desk, a circle, a button, and even a loan can all be viewed as objects. **An object has a unique identity**, state, and behaviors. The **state** of an object consists of a set of **data fields** (also known as *properties*) with their current values. The **behavior** of an object is defined by a set of methods.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Java Class & Objects

Class

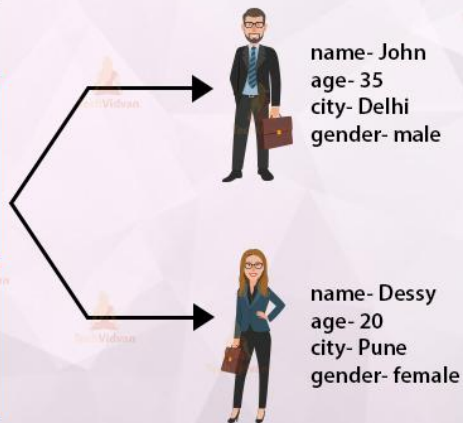

Person

Data Members

unique_id
name
age
city
gender

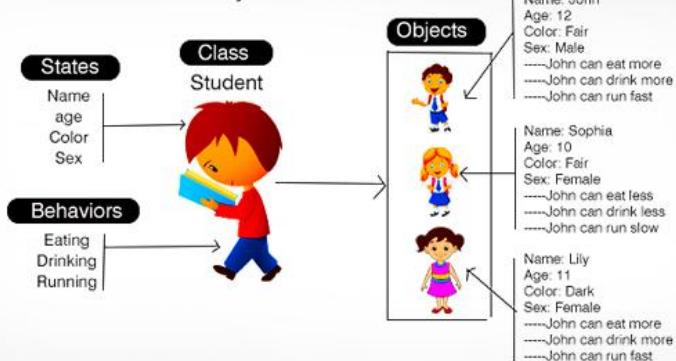

Methods

eat()
study()
sleep()
play()

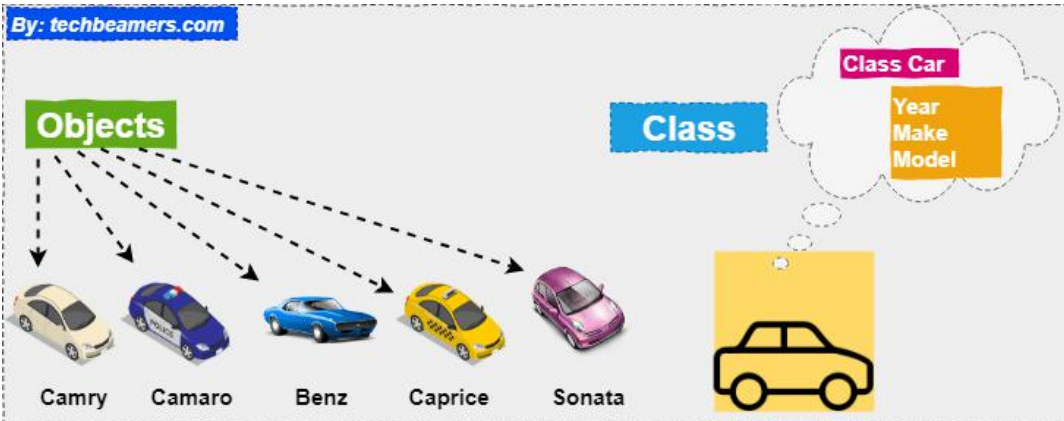

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

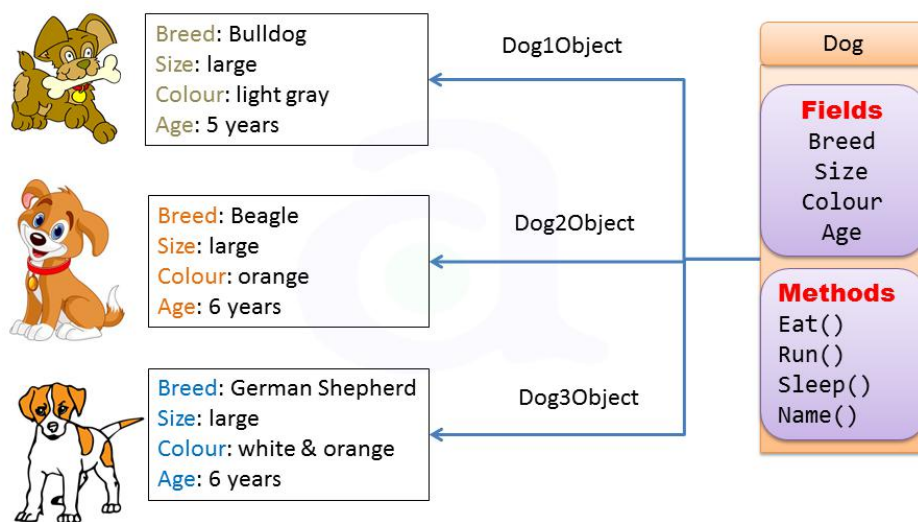

Objects and Class

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

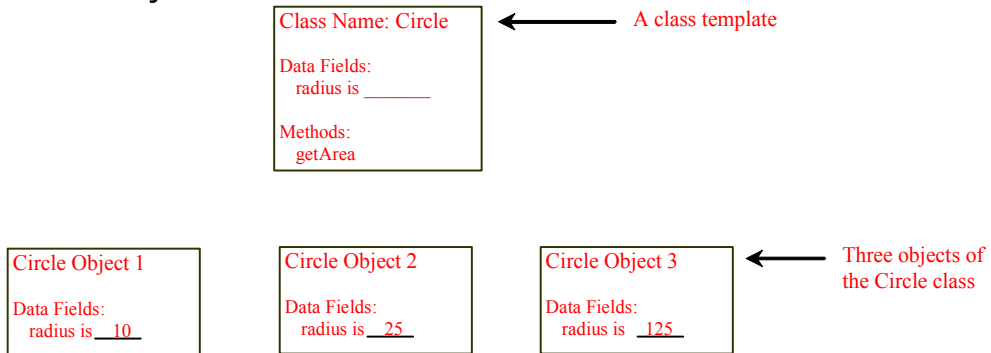

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Objects

An object has **both a state and behavior**. The state defines the object, and the behavior defines what the object does.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Classes

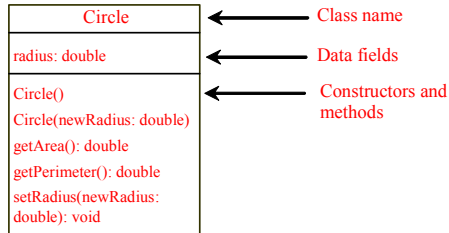

Classes are constructs that define **objects** of the same type. A Java class uses **variables to define data fields and methods to define behaviors**. Additionally, a class provides a special type of methods, **known as constructors**, which are invoked to construct objects from the class.

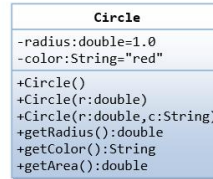

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

UML Class Diagram: Unified Modeling Language

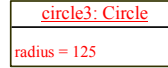

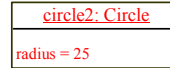

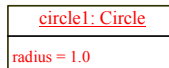

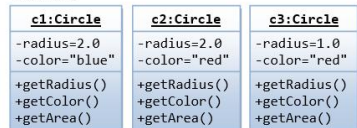

UML Class Diagram

Class Definition

Instances

UML notation for objects

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

```

class SimpleCircle {
    double radius;

    /** Construct a circle with radius 1 */
    SimpleCircle() {
        radius = 1;
    }

    /** Construct a circle with a specified radius */
    SimpleCircle(double newRadius) {
        radius = newRadius;
    }

    /** Return the area of this circle */
    double getArea() {
        return radius * radius * Math.PI;
    }
}
  
```

```

    /** Return the perimeter of this circle */
    double getPerimeter() {
        return 2 * radius * Math.PI;
    }

    /** Set a new radius for this circle */
    void setRadius(double newRadius) {
        radius = newRadius;
    }
}
  
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

```

public class TestSimpleCircle {
    /** Main method */
    public static void main(String[] args) {
        // Create a circle with radius 1
        SimpleCircle circle1 = new SimpleCircle();
        System.out.println("The area of the circle
of radius "
        + circle1.radius + " is " +
circle1.getArea());

        // Create a circle with radius 25
        SimpleCircle circle2 = new
SimpleCircle(25);
        System.out.println("The area of the circle
of radius "
        + circle2.radius + " is " +
circle2.getArea());
    }
}

```

```

// Create a circle with radius 125
SimpleCircle circle3 = new SimpleCircle(125);
System.out.println("The area of the circle of
radius "
        + circle3.radius + " is " + circle3.getArea());

// Modify circle radius
circle2.radius = 100; // or
circle2.setRadius(100)
System.out.println("The area of the circle of
radius "
        + circle2.radius + " is " + circle2.getArea());
    }
}

```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Example: Defining Classes and Creating Objects

The + sign indicates a public modifier.

TV
channel: int volumeLevel: int on: boolean
+TV () +turnOn(): void +turnOff(): void +setChannel(newChannel: int): void +setVolume(newVolumeLevel: int): void +channelUp(): void +channelDown(): void +volumeUp(): void +volumeDown(): void

The current channel (1 to 120) of this TV.
The current volume level (1 to 7) of this TV.
Indicates whether this TV is on/off.

Constructs a default TV object.
Turns on this TV.
Turns off this TV.
Sets a new channel for this TV.
Sets a new volume level for this TV.
Increases the channel number by 1.
Decreases the channel number by 1.
Increases the volume level by 1.
Decreases the volume level by 1.

TV

TestTV

Run

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

```

public class TV {
    int channel = 1; // Default channel is 1
    int volumeLevel = 1; // Default volume level is 1
    boolean on = false; // By default TV is off

    public TV() {
    }

    public void turnOn() {
        on = true;
    }

    public void turnOff() {
        on = false;
    }

    public void setChannel(int newChannel) {
        if (on && newChannel >= 1 && newChannel <= 120)
            channel = newChannel;
    }
}

```

```

    public void setVolume(int newVolumeLevel) {
        if (on && newVolumeLevel >= 1 && newVolumeLevel <= 7)
            volumeLevel = newVolumeLevel;
    }

    public void channelUp() {
        if (on && channel < 120)
            channel++;
    }

    public void channelDown() {
        if (on && channel > 1)
            channel--;
    }

    public void volumeUp() {
        if (on && volumeLevel < 7)
            volumeLevel++;
    }

    public void volumeDown() {
        if (on && volumeLevel > 1)
            volumeLevel--;
    }
}

```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

```

public class TestTV {
    public static void main(String[] args) {
        TV tv1 = new TV(); // Create a TV
        tv1.turnOn(); // Turn on tv1
        tv1.setChannel(30);
        tv1.setVolume(3);

        TV tv2 = new TV();
        tv2.turnOn();
        tv2.channelUp();
        tv2.channelUp();
        tv2.volumeUp(); // Increase tv2 volume up 1 level

        System.out.println("tv1's channel is " + tv1.channel + " and volume level is " + tv1.volumeLevel);
        System.out.println("tv2's channel is " + tv2.channel + " and volume level is " + tv2.volumeLevel);
    }
}

```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Constructors

```
Circle() {  
}
```

```
Circle(double newRadius) {  
    radius = newRadius;  
}
```

Constructors are a special kind of methods that are invoked to construct objects.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Constructors, cont.

A constructor with no parameters is referred to as a *no-arg constructor*.

- Constructors must have the **same name as the class itself**.
- Constructors **do not have a return type—not even void**.
- Constructors are invoked using the **new operator when an object is created**. Constructors play the role of initializing objects.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Creating Objects Using Constructors

```
new ClassName() ;
```

Example:

```
new Circle() ;
```

```
new Circle(5.0) ;
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Default Constructor

A class may be defined without constructors. In this case, a no-arg constructor with an empty body is implicitly defined in the class. This constructor, called *a default constructor*, is provided automatically **only if no constructors are explicitly defined in the class.**

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Declaring Object Reference Variables

To reference an object, assign the object to a reference variable.

To declare a reference variable, use the syntax:

ClassName objectRefVar;

Example:

Circle myCircle;

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Declaring/Creating Objects in a Single Step

ClassName objectRefVar = new ClassName();

Example:

Circle myCircle = new Circle();

Assign object reference

Create an object

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Accessing Object's Members

❑ Referencing the object's data:

`objectRefVar.data`

e.g., myCircle.radius

❑ Invoking the object's method:

`objectRefVar.methodName (arguments)`

e.g., myCircle.getArea()

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

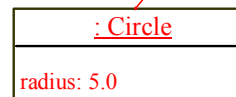

Trace Code, cont.

```
Circle myCircle = new Circle(5.0);
```

```
Circle yourCircle = new Circle();
```

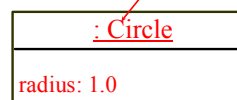

```
yourCircle.radius = 100;
```

myCircle reference value

yourCircle reference value

Assign object reference
to yourCircle

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

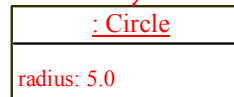

Trace Code, cont.

```
Circle myCircle = new Circle(5.0);
```

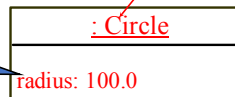

```
Circle yourCircle = new Circle();
```

```
yourCircle.radius = 100;
```

myCircle reference value

yourCircle reference value

Change radius in
yourCircle

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Caution

Recall that you use

Math.methodName(arguments) (e.g., `Math.pow(3, 2.5)`)

to invoke a method in the `Math` class

Can you invoke `getArea()` using `SimpleCircle.getArea()`? The answer is no. All the methods used before this chapter **are static methods**, which are defined using the `static` keyword. However, **`getArea()` is non-static**. It must be invoked from an object using

`objectRefVar.methodName(arguments)` (e.g., `myCircle.getArea()`).

More explanations will be given in the section on “Static Variables, Constants, and Methods.”

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Reference Data Fields

The data fields can be of reference types. For example, the following Student class contains a data field name of the String type.

```
public class Student {  
    String name; // name has default value null  
    int age; // age has default value 0  
    boolean isScienceMajor; // isScienceMajor has default value false  
    char gender; // c has default value '\u0000'  
}
```

The null Value

If a data field of a reference type does not reference any object, the data field holds a special literal value, null.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njourn

Default Value for a Data Field

The default value of a data field is null for a reference type, 0 for a numeric type, false for a boolean type, and '\u0000' for a char type. However, Java assigns no default value to a local variable inside a method.

```
public class Test {  
    public static void main(String[] args) {  
        Student student = new Student();  
        System.out.println("name? " + student.name);  
        System.out.println("age? " + student.age);  
        System.out.println("isScienceMajor? " + student.isScienceMajor);  
        System.out.println("gender? " + student.gender);  
    }  
}
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njourn

Example

Java assigns no default value to a local variable inside a method.

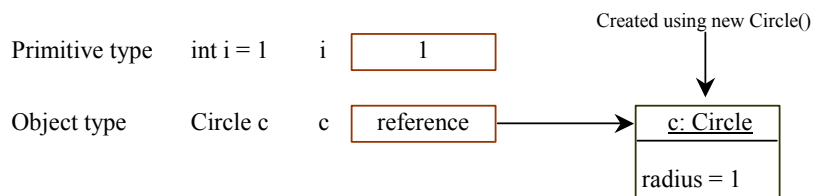

```
public class Test {  
    public static void main(String[] args) {  
        int x; // x has no default value  
        String y; // y has no default value  
        System.out.println("x is " + x);  
        System.out.println("y is " + y);  
    }  
}
```

Compile error: variable not initialized

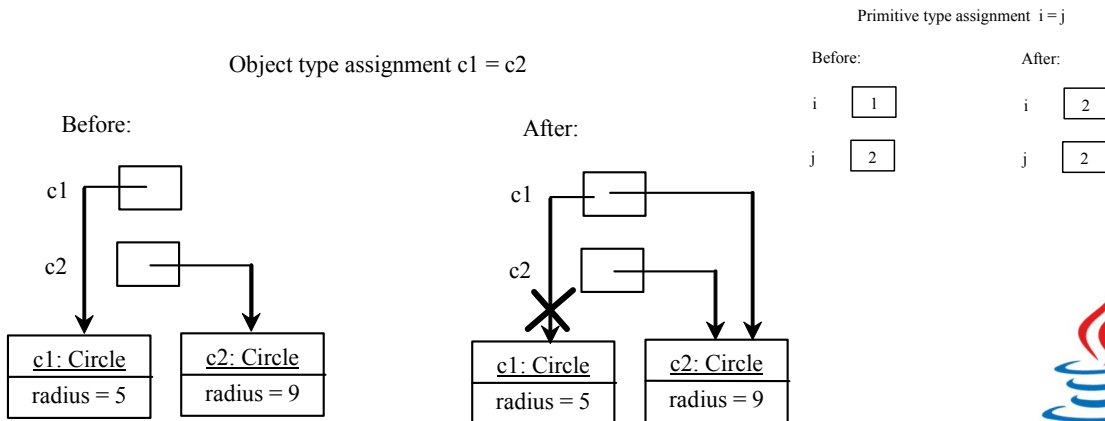

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Differences between Variables of Primitive Data Types and Object Types

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Copying Variables of Primitive Data Types and Object Types

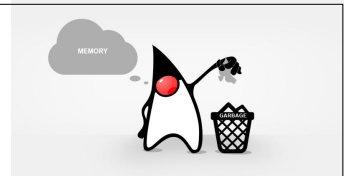

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Garbage Collection

As shown in the previous figure, after the assignment statement $c1 = c2$, $c1$ points to the same object referenced by $c2$. The object previously referenced by $c1$ is no longer referenced. This object is known as garbage. **Garbage is automatically collected by JVM.**

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Garbage Collection,

TIP: If you know that an object is **no longer needed**, you can explicitly assign null to a reference variable for the object. The JVM will automatically collect the space if the object is not referenced by any variable.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

The Date Class

Java provides a system-independent encapsulation of date and time in the java.util.Date class. You can use the Date class to create an instance for the current date and time and use its toString method to return the date and time **as a string**.

The + sign indicates
public modifier

java.util.Date
+Date()
+Date(elapseTime: long)
+toString(): String
+getTime(): long
+setTime(elapseTime: long): void

Constructs a Date object for the current time.
Constructs a Date object for a given time in milliseconds elapsed since January 1, 1970, GMT.
Returns a string representing the date and time.
Returns the number of milliseconds since January 1, 1970, GMT.
Sets a new elapse time in the object.

`new Date(120,9, 12,23,56,25);`
2020 Oct Day Time 24 hours format

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

The Date Class Example

For example, the following code

```
java.util.Date date = new java.util.Date();  
//current date  
System.out.println(date.toString());
```

displays a string like Mon Oct 12 19:10:18 IDT 2020.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njourn

The Random Class

You have used Math.random() to obtain a random double value between 0.0 and 1.0 (excluding 1.0). A more useful random number generator is provided in the java.util.Random class.

java.util.Random	
+Random()	Constructs a Random object with the current time as its seed.
+Random(seed: long)	Constructs a Random object with a specified seed.
+nextInt(): int	Returns a random int value.
+nextInt(n: int): int	Returns a random int value between 0 and n (exclusive).
+nextLong(): long	Returns a random long value.
+nextDouble(): double	Returns a random double value between 0.0 and 1.0 (exclusive).
+nextFloat(): float	Returns a random float value between 0.0F and 1.0F (exclusive).
+nextBoolean(): boolean	Returns a random boolean value.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njourn

The Random Class Example

If two Random objects have the same seed, they will generate identical sequences of numbers. For example, the following code creates two Random objects with the same **seed 3**.

```
Random random1 = new Random(3);
System.out.print("From random1: ");
for (int i = 0; i < 10; i++)
    System.out.print(random1.nextInt(1000) + " ");
Random random2 = new Random(3);
System.out.print("\nFrom random2: ");
for (int i = 0; i < 10; i++)
    System.out.print(random2.nextInt(1000) + " ");
```

From random1: 734 660 210 581 128 202 549 564 459 961
From random2: 734 660 210 581 128 202 549 564 459 961

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Instance Variables, and Methods

- Instance variables belong to a specific instance.
- Instance methods are invoked by an instance of the class.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Static Variables, Constants, and Methods

Static variables are shared by all the instances of the class.

Static methods are not tied to a specific instance (object).

Static constants are final variables shared by all the instances of the class.

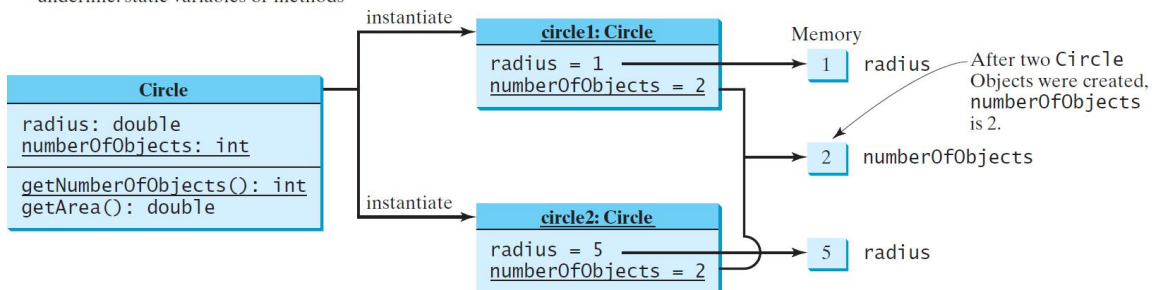

To declare static variables, constants, and methods, use the static modifier.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Static Variables, Constants, and Methods, cont.

UML Notation:
underline: static variables or methods

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Example of Using Instance and Class Variables and Method

Objective: Demonstrate the roles of instance and class variables and their uses. This example adds a class variable `numberOfObjects` to track the number of `Circle` objects created.

CircleWithStaticMembers

TestCircleWithStaticMember

Run

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

```
public class CircleWithStaticMembers {
    /** The radius of the circle */
    double radius;

    /** The number of the objects created */
    static int numberOfObjects = 0;

    /** Construct a circle with radius 1 */
    CircleWithStaticMembers() {
        radius = 1.0;
        numberOfObjects++;
    }

    /** Construct a circle with a specified radius */
    CircleWithStaticMembers(double newRadius)
    {
        radius = newRadius;
        numberOfObjects++;
    }

    /** Return numberOfObjects */
    static int getNumberOfObjects() {
        return numberOfObjects;
    }

    /** Return the area of this circle */
    double getArea() {
        return radius * radius * Math.PI;
    }
}
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Static Variable

1. It is a **variable** which belongs to the **class** and **not to the instance** (object).

2. Static variables are initialized **only once**, at the **start** of the execution.

Static variables will be **initialized first, before** the initialization of any instance variables.

3. A **single copy** to be shared by **all instances of the class**.

4. A static variable can be **accessed directly** by the **class name** and doesn't **need any instance of class (object)**.

Syntax : < class - name>.<static - variable - name>

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Static Method

1. It is a method which **belongs to the class and not to the instance** (object).

2. A static method **can access only static data**. It **can not access non-static** data (instance variables).

3. A static method **can call only other static** methods and **can not call a non-static method from method inside. (main and other methods inside class)**

4. A static method can be **accessed directly by the class** name and doesn't need any create an instance (object) to access it.

Syntax : < class - name>.<static - method - name>(..)

5. **A static method cannot refer to "this" or "super" keywords in anyway.**

Note: main method is static, since it must be accessible for an application to run, **before any instantiation takes place**.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

```

public class Checkstatic {
    public static void main(String[] args) {

        Check c1 = new Check();
        System.out.println(c1.getX());
        System.out.println(c1.x); // warning: static field should be accessed in static way

        Check c2 = new Check();
        System.out.println(c2.getX());
        System.out.println(c2.x); // warning: static field should be accessed in static way
    }
}

class Check {
    static int x = 0;
    int y;

    Check() {
        x++;
    }

    Check(int xvalue) {
        y = xvalue;
        x++;
    }

    public int getX() {
        return x;
    }
}

```

The static field Check.x should be accessed in a static way

1
1
2
2

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

```

public class Checkstatic {
    public static void main(String[] args) {

        System.out.println(Check.x);

        Check.setX(5);

        System.out.println(Check.getX());
    }
}

class Check{
    static int x=0;
    int y;
    Check(){
    }

    public static void setX(int xvalue){
        x=xvalue;
    }
    public static int getX(){
        return x;
    }
}

```

We accessed in a static way
Since no instance object created

0
5

```

public class Checkstatic {
    public static void main(String[] args) {

        System.out.println(Check.x);

        Check.setX(5); //error: cannot make static reference to non-
static
        System.out.println(Check.getX()); //error: cannot make static
reference to non-static
    }
}

class Check{
    static int x=0;
    int y;
    Check(){
    }

    public void setX(int xvalue){
        x=xvalue;
    }
    public int getX(){
        return x;
    }
}

```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Visibility Modifiers and Accessor/Mutator Methods

“A Mutator method is commonly known as a set method or simply a setter”

“It shows us the principle of encapsulation”

By default, the class, variable, or method can be accessed by any class in the same package.

□ **public**

The class, data, or method is **visible** to any class in any **package**.

□ **private**

The data or methods can be accessed only by the **declaring class**.

The **get and set methods are used to read** and modify **private properties.(variables)**

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

```
package p1;

public class C1 {
    public int x;
    int y;
    private int z;

    public void m1() {
    }
    void m2() {
    }
    private void m3() {
    }
}
```

```
package p1;

public class C2 {
    void aMethod() {
        C1 o = new C1();
        can access o.x;
        can access o.y;
        cannot access o.z;
    }

    can invoke o.m1();
    can invoke o.m2();
    cannot invoke o.m3();
}
```

```
package p2;

public class C3 {
    void aMethod() {
        C1 o = new C1();
        can access o.x;
        cannot access o.y;
        cannot access o.z;
    }

    can invoke o.m1();
    cannot invoke o.m2();
    cannot invoke o.m3();
}
```

The private modifier restricts access to within a class, the default modifier restricts access to within a package, and the public modifier enables unrestricted access.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

<div> <div>Most Restrictive</div> <div>←</div> <div>→</div> <div>Least Restrictive</div> </div>				
Access Modifiers ->	private	Default/no-access	protected	public
Inside class	Y	Y	Y	Y
Same Package Class	N	Y	Y	Y
Same Package Sub-Class	N	Y	Y	Y
Other Package Class	N	N	N	Y
Other Package Sub-Class	N	N	Y	Y

Same rules apply for inner classes too, they are also treated as outer class properties

```
package p1;

class C1 {
    ...
}
```

```
package p1;

public class C2 {
    can access C1
}
```

```
package p2;

public class C3 {
    cannot access C1;
    can access C2;
}
```

The default modifier on a class restricts access to within a package, and the public modifier enables unrestricted access.

NOTE

An object **cannot access its private members**, as shown in (b).
It is OK, however, if the object is **declared in its own class**, as shown in (a).

```
public class C {  
    private boolean x;  
  
    public static void main(String[] args) {  
        C c = new C();  
        System.out.println(c.x);  
        System.out.println(c.convert());  
    }  
  
    private int convert() {  
        return x ? 1 : -1;  
    }  
}
```

(a) This is okay because object `c` is used inside the class `C`.

```
public class Test {  
    public static void main(String[] args) {  
        C c = new C();  
        System.out.println(c.x);  
        System.out.println(c.convert());  
    }  
}
```

(b) This is wrong because `x` and `convert` are private in class `C`.

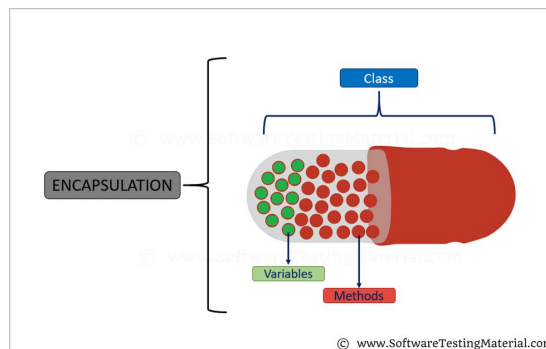

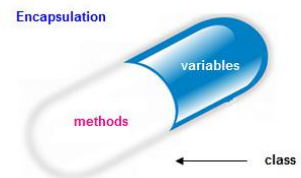

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Why Data Fields Should Be private?

To protect data.

To make code easy to maintain.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Example of Data Field Encapsulation

The - sign indicates private modifier

Circle
-radius: double -numberOfObjects: int
+Circle() +Circle(radius: double) +getRadius(): double +setRadius(radius: double): void +getNumberOfObjects(): int +getArea(): double

The radius of this circle (default: 1.0).

The number of circle objects created.

Constructs a default circle object.

Constructs a circle object with the specified radius.

Returns the radius of this circle.

Sets a new radius for this circle.

Returns the number of circle objects created.

Returns the area of this circle.

CircleWithPrivateDataFields

TestCircleWithPrivateDataFields

Run

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Passing Objects to Methods

```
public class TestPassObject {
    /** Main method */
    public static void main(String[] args) {
        // Create a Circle object with radius 1
        CircleWithPrivateDataFields myCircle = new CircleWithPrivateDataFields(1);
        // Print areas for radius 1, 2, 3, 4, and 5.
        int n = 5;
        printAreas(myCircle, n);

        // See myCircle.radius and times
        System.out.println('\n' + 'Radius is ' + myCircle.getRadius());
        System.out.println('n is ' + n);
    }
    /** Print a table of areas for radius */
    public static void printAreas(CircleWithPrivateDataFields c, int times) {
        System.out.println('Radius \t\tArea');
        while (times != 1) {
            System.out.println(c.getRadius() + '\t\t' + c.getArea());
            c.setRadius(c.getRadius() + 1);
            times--;
        }
    }
}
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Passing Objects to Methods

- ❑ Passing by value for primitive type value (the value is passed to the parameter)
- ❑ Passing by value for reference type value (the value is the reference to the object)

Radius	Area
1.0	3.141592653589793
2.0	12.566370614359172
3.0	28.274333882308138
4.0	50.26548245743669
5.0	78.53981633974483

Radius is 6.0n is 5

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Array of Objects

```
Circle[] circleArray = new Circle[10];
```

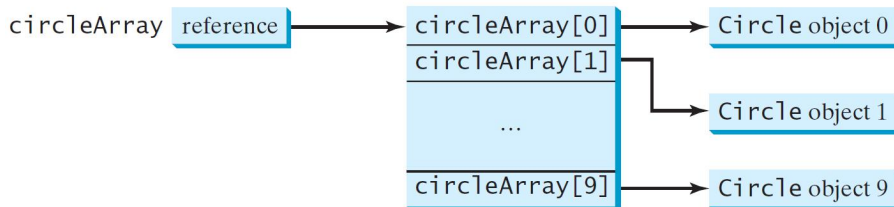

An array of objects is actually an *array of reference variables*. So invoking **circleArray[1].getArea()** involves two levels of referencing as shown in the next figure. circleArray references to the entire array. **circleArray[1]** references to a **Circle object**.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Array of Objects, cont.

```
Circle[] circleArray = new Circle[10];
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Immutable(Cannot change) Objects and Classes

If the contents of an object cannot be changed once the object is created, the object is called an immutable object and its class is called an immutable class. If you delete the set method in the Circle class in Listing 8.10, the class would be immutable because radius is private and cannot be changed without a set method.

A class with all private data fields and without mutators (no setter) is not necessarily immutable. For example, the following class Student has all private data fields and no mutators, but it is mutable.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoun

Example

```
public class Student {
    private int id;
    private BirthDate birthDate;

    public Student(int ssn,
        int year, int month, int day) {
        id = ssn;
        birthDate = new BirthDate(year, month, day);
    }

    public int getId() {
        return id;
    }

    public BirthDate getBirthDate() {
        return birthDate;
    }
}
```

```
public class BirthDate {
    private int year;
    private int month;
    private int day;

    public BirthDate(int newYear,
        int newMonth, int newDay) {
        year = newYear;
        month = newMonth;
        day = newDay;
    }

    public void setYear(int newYear) {
        year = newYear;
    }
}
```

```
public class Test {
    public static void main(String[] args) {
        Student student = new Student(111223333, 1970, 5, 3);
        BirthDate date = student.getBirthDate();
        date.setYear(2010); // Now the student birth year is changed!
    }
}
```

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Scope of Variables

- ❑ The scope of instance and static variables is the entire class.

They can be declared anywhere inside a class.

- ❑ The scope of a local variable starts from its declaration and continues to the end of the block that contains the variable. A local variable must be initialized explicitly before it can be used.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Immutable Class

غير قابل للتغير

- Immutable class means that once an object is created, **we cannot change its content.**
- The class must be declared as **final** (So that child classes can't be created)
- Data members in the **class must be declared as final** (So that we can't change the value of it after object creation)
- A parameterized constructor
- **Getter method for all the variables in it**
- **No setters** (To not have the option to change the value of the instance variable)

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Example

// An immutable class

public final class Student

{ **final** String name;

final int regNo;

public Student(String name, int regNo)

 { this.name = name;

 this.regNo = regNo;

 }

public String getName()

 { return name; }

public int getRegNo()

 { return regNo; }

}

// Driver class

class Test

{

public static void main(String args[])

 {

 Student s = new Student("ABC", 101);

 System.out.println(s.getName());

 System.out.println(s.getRegNo());

 }

}

// Uncommenting below line causes error

// s.regNo = 102;

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

- ❑ The this keyword is the name of a reference that refers to an object itself. One common use of the this keyword is reference a class's **hidden data fields**.
- ❑ Another common use of the this keyword to enable a constructor to invoke **another constructor of the same class**.

Remember : . A static method cannot refer to “this” or “super” keywords in anyway.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Reference the Hidden Data Fields

```
public class F {  
    private int i = 5;  
    private static double k = 0;  
  
    void setI(int i) {  
        this.i = i;  
    }  
  
    static void setK(double k) {  
        F.k = k;  
    }  
}
```

Suppose that f1 and f2 are two objects of F.
F f1 = new F(); F f2 = new F();

Invoking f1.setI(10) is to execute
this.i = 10, where **this** refers f1

Invoking f2.setI(45) is to execute
this.i = 45, where **this** refers f2

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

Calling Overloaded Constructor

```
public class Circle {  
    private double radius;  
  
    public Circle(double radius) {  
        this.radius = radius;  
    }  
  
    public Circle() {  
        this(1.0);  
    }  
  
    public double getArea() {  
        return this.radius * this.radius * Math.PI;  
    }  
}
```

→ this must be explicitly used to reference the data field radius of the object being constructed

→ this is used to invoke another constructor

↓ ↓

Every instance variable belongs to an instance represented by this, which is normally omitted
