

# **Class Representation**

An aggregation relationship is usually represented as a data field in the aggregating class. For example, the relationship in Figure 10.6 can be represented as follows:

STUDENTS-HUB.com

#### Example: The StackOfIntegers Class StackOfIntegers -elements: int[] An array to store integers in the stack. -size: int The number of integers in the stack. Constructs an empty stack with a default capacity of 16. +StackOfIntegers() +StackOfIntegers(capacity: int) Constructs an empty stack with a specified capacity. +empty(): boolean Returns true if the stack is empty. Returns the integer at the top of the stack without +peek(): int removing it from the stack. +push(value: int): int Stores an integer into the top of the stack. +pop(): int Removes the integer at the top of the stack and returns it. +getSize(): int Returns the number of elements in the stack. ### The Integer and Double Classes

java.lang.Integer	java.lang.Double
-value: int	-value: double
+MAX_VALUE: int	+MAX_VALUE: double
+MIN VALUE: int	+MIN VALUE: double
+Integer(value: int)	+Double(value: double)
+Integer(s: String)	+Double(s: String)
+byteValue(): byte	+byteValue(): byte
+shortValue(): short	+shortValue(): short
+intValue(): int	+intValue(): int
+longVlaue(): long	+longVlaue(): long
+floatValue(): float	+floatValue(): float
+doubleValue():double	+doubleValue():double
+compareTo(o: Integer): int	+compareTo(o: Double): int
+toString(): String	+toString(): String
+valueOf(s: String): Integer	+valueOf(s: String): Double
+valueOf(s: String, radix: int): Integer	+valueOf(s: String, radix: int): Double
+parseInt(s: String): int	+parseDouble(s: String): double
<pre>+parseInt(s: String, radix: int): int</pre>	+parseDouble(s: String, radix: int): double

## Numeric Wrapper Class Constants

Each numerical wrapper class has the constants <u>MAX\_VALUE</u> and <u>MIN\_VALUE</u>. <u>MAX\_VALUE</u> represents the maximum value of the corresponding primitive data type. For <u>Byte</u>, <u>Short</u>, <u>Integer</u>, and <u>Long</u>, <u>MIN\_VALUE</u> represents the minimum <u>byte</u>, <u>short</u>, <u>int</u>, and <u>long</u> values. For <u>Float</u> and <u>Double</u>, <u>MIN\_VALUE</u> represents the minimum <u>positive</u> float and <u>double</u> values. The following statements display the maximum integer (2,147,483,647), the minimum positive float (1.4E-45), and the maximum double floating-point number (1.79769313486231570e+308d).

# The Static valueOf Methods

The numeric wrapper classes have a useful class method, valueOf(String s). This method creates a new object initialized to the value represented by the specified string. For example:

Double doubleObject = Double.valueOf("12.4"); Integer integerObject = Integer.valueOf("12");

## The Methods for Parsing Strings into Numbers

You have used the parseInt method in the Integer class to parse a numeric string into an int value and the parseDouble method in the Double class to parse a numeric string into a double value. Each numeric wrapper class has two overloaded parsing methods to parse a numeric string into an appropriate numeric value.
