4.2 Transmittance through Double Interface at Subcritical angles

How Much Power is transmitted or reflected from double-Interface?

$$t_s^{tot} = \frac{t_s^{0\to1} e^{ik_1 d\cos\theta_1} t_s^{1\to2}}{1 - r_s^{0\leftarrow1} r_s^{1\to2} e^{2ik_1 d\cos\theta_1}}$$

Using (3.33) $\quad T_s^{tot} = \frac{n_t \cos\theta_t}{n_i \cos\theta_i} |t_s|^2 \; ; \quad$ θ_2 is real

$\theta_1 < \theta_c$

$$= \frac{n_2 \cos\theta_2}{n_0 \cos\theta_0} \left| t_s^{tot} \right|^2$$

$$T_s^{tot} = \frac{n_2 \cos\theta_2}{n_0 \cos\theta_0} \frac{\left| t_s^{0\to1} \right|^2 \left| t_s^{1\to2} \right|^2}{\left| e^{-ik_1 d\cos\theta_1} - r_s^{0\leftarrow1} r_s^{1\to2} e^{ik_1 d\cos\theta_1} \right|^2}$$

This can be written as

$$T_s^{tot} = \frac{T_s^{max}}{1 + F_s \sin^2\left(\frac{\Phi_s}{2}\right)}$$

$$T_s^{max} \equiv \frac{T_s^{0\to1} \; T_s^{1\to2}}{\left(1 - \sqrt{R_s^{0\leftarrow1} \; R_s^{1\to2}}\right)^2}$$

$$\Phi_s = 2k_1 d \cos\theta_1 + \phi_{r_s}^{0\leftarrow1} + \phi_{r_s}^{1\to2}$$

$$F_s = \frac{4\sqrt{R_s^{0\leftarrow1} \; R_s^{1\to2}}}{\left(1 - \sqrt{R_s^{0\leftarrow1} \; R_s^{1\to2}}\right)^2}$$

$\phi_{r_s}^{0\leftarrow1}$, $\phi_{r_s}^{1\to2}$: possible phase shifts upon reflection.

$$r_s^{0\leftarrow1} = |r_s^{0\leftarrow1}| \, e^{i\phi_{r_s}^{0\leftarrow1}}$$

$$r_s^{1\to2} = |r_s^{1\to2}| \, e^{i\phi_{r_s}^{1\to2}}$$
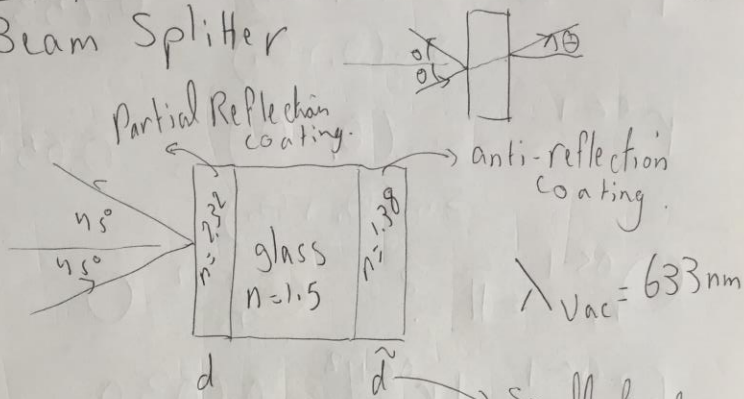

<u>Note</u>: If all n's are real,
$\phi_{r_s}^{0\leftarrow1}$ & $\phi_{r_s}^{1\to2}$ are 0 or π.

F_s = coefficient of finesse; How is T^{tot} changed by Φ_s?

Example 4.2

Beam Splitter

Partial Reflection coating → anti-reflection coating

$\lambda_{vac} = 633\,nm$

glass $n = 1.5$

$n_o = 2.32$ $n_i = 1.38$

$45°$ $45°$

d $\hat{d}$

$\hat{d}$ → Smallest value to give highest Transmitt. through back?

$n = 1.5$ $n = 1.38$ $n = 1$

$\hat{d}$
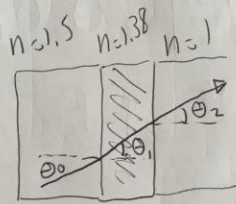

$n_o = 1.5$ (glass) ; $n_1 = 1.38$; $n_2 = 1$ (air)

$\Theta_2 = 45°$?

$n_1 \sin\Theta_1 = n_2 \sin\Theta_2 = \sin\Theta_2 \Rightarrow \Theta_1 = 30.82°$

$n_o \sin\Theta_o = n_1 \sin\Theta_1 = \sin\Theta_2 \Rightarrow \Theta_o = 28.13°$

$$r_s^{1 \to 2} = -\frac{\sin(\theta_1 - \theta_2)}{\sin(\theta_1 + \theta_2)} = 0.253$$

$$r_s^{0 \leftarrow 1} = -\frac{\sin(\theta_1 - \theta_0)}{\sin(\theta_1 + \theta_0)} = -0.0549$$

$$\bigoplus \theta_{rs}^{0 \leftarrow 1} = \pi \; ? \qquad \bigoplus \theta_{rs}^{1 \to 2} = 0$$

$$R_s^{0 \leftarrow 1} = |r_s^{0 \leftarrow 1}|^2 = 0.0030$$

$$R_s^{1 \to 2} = |r_s^{1 \to 2}|^2 = 0.0640$$

$$T_s^{0 \to 1} \stackrel{??}{=} T_s^{0 \leftarrow 1} = 1 - R_s^{0 \leftarrow 1} = 0.997$$

$$T_s^{1 \to 2} = 1 - R_s^{1 \to 2} = 1 - 0.0640 = 0.936$$

$$F = \frac{4\sqrt{R_s^{0 \leftarrow 1} R_s^{1 \to 2}}}{\left(1 - \sqrt{R_s^{0 \leftarrow 1} R_s^{1 \to 2}}\right)^2} = 0.0570$$

$$T_s^{max} = 0.960$$

$$\overline{I}_s^{\,tot} = \frac{0.960}{1 + 0.0570 \sin^2\left(\dfrac{2k_1 \tilde{d}\cos\theta_1 + \pi}{2}\right)} \qquad \text{⑤}$$

$\overline{I}_s^{\,tot}$ is max when $\leftarrow = 0$

$\overline{I}_s^{\,tot}$ (max) $= 0.960$

if we remove $\tilde{d}$ then $\overline{I}_s^{\,tot} = 0.908$

smallest $\tilde{d}$:

let $2k_1 \tilde{d}\cos\theta_1 + \pi = 2\pi$?? (Why not zero)
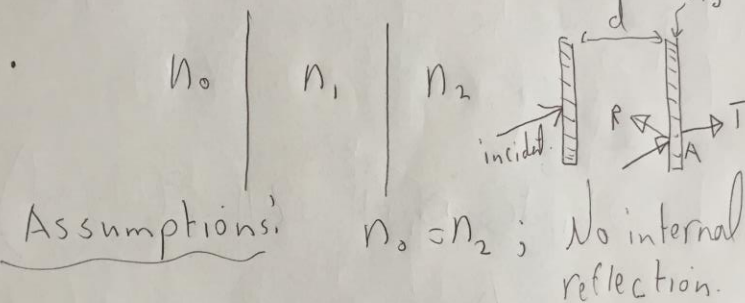

$k_1 = 2\pi n_1 / \lambda_{vac}$

$$\boxed{\tilde{d} = 134\,nm}$$

4.4 Fabry - Perot Instrument ⑥

- Fabry - Perot Interferometer: $|\overset{\leftrightarrow}{d}|$

  adjustable

- Fabry - Perot Etalon $|\overset{\leftrightarrow}{d}|$

  fixed

$$n_0 \quad | \quad n_1 \quad | \quad n_2$$

incident, R, T, A, d, Ag

Assumptions: $n_0 = n_2$; No internal reflection.

$$T^{tot} = \frac{T^{max}}{1 + F \sin^2\left(\frac{\phi}{2}\right)}$$

- for $n_0 = n_2$

$$T = T^{0 \to 1} = T^{1 \to 2}$$
$$R = R^{0 \to 1} = R^{1 \to 2}$$

$$I^{max} = \frac{I^2}{(1-R)^2} \quad ; \quad F = \frac{4R}{(1-R)^2}$$

$$\Phi_s = 2k_1 d \cos\theta_1 + \phi_{r_s}^{0\leftarrow 1} + \phi_{r_s}^{1\to 2}$$

$$= 2\left(\frac{2\pi n_1}{\lambda_{vac}}\right) d \cos\theta_1 + 2\phi_r$$

max

I^{tot}

$f=0.1$ Why??

$F=1$

0   2π 4π Φ $F=100$
