

Simple Methods for String Objects Strings are objects in Java. The methods in the preceding table can only be invoked from a specific string instance. For this reason, these methods are called <u>instance methods</u>. A non-instance method is called a static method. A static method can be invoked without using an object. All the methods defined in the Math class are static methods. They are not tied to a specific object instance. The syntax to invoke an instance method is referenceVariable.methodName(arguments).

Reading a Character from the Console

Scanner input = new Scanner(System.in);

System.out.print("Enter a character: ");

String s = input.nextLine();

char ch = s.charAt(0);

System.out.println("The character entered is " + ch);

Comparing Strings

Method	Description	
equals(s1)	Returns true if this string is equal to string s1.	
equalsIgnoreCase(s1)	Returns true if this string is equal to string s1; it is case insensitive.	
compareTo(s1)	Returns an integer greater than 0, equal to 0, or less than 0 to indicate whether this string is greater than, equal to, or less than s1.	
compareToIgnoreCase(s1)	Same as compareTo except that the comparison is case insensitive.	
startsWith(prefix)	Returns true if this string starts with the specified prefix.	
endsWith(suffix)	Returns true if this string ends with the specified suffix.	
String city2 = input.nextLine(); if (city1.compareTo(city2) < 0) System.out.println('The cities i	ocities city: '); System.out.print('Enter the second city: '); n alphabetical order are ' + city1 + ' ' + city2);	
}	ties in alphabetical order are ' + city2 + ' ' + city1);	Java

Finding a Character or a Substring in a String

indexOf(ch)	Returns the index of the first occurrence of ch in the string. Returns -1 if not matched.	
<pre>indexOf(ch, fromIndex)</pre>	Returns the index of the first occurrence of ch after fromIndex in the string. Returns -1 if not matched.	
indexOf(s)	Returns the index of the first occurrence of string s in this string. Returns -1 if not matched.	
<pre>indexOf(s, fromIndex)</pre>	Returns the index of the first occurrence of string s in this string after fromIndex. Returns -1 if not matched.	1
lastIndexOf(ch)	Returns the index of the last occurrence of ch in the string. Returns -1 if not matched.	
<pre>lastIndexOf(ch, fromIndex)</pre>	Returns the index of the last occurrence of ch before fromIndex in this string. Returns -1 if not matched.	2
lastIndexOf(s)	Returns the index of the last occurrence of string s. Returns -1 if not matched.	2
<pre>lastIndexOf(s, fromIndex)</pre>	Returns the index of the last occurrence of string s before fromIndex. Returns -1 if not matched.	lav

Convert Character and Numbers to Strings

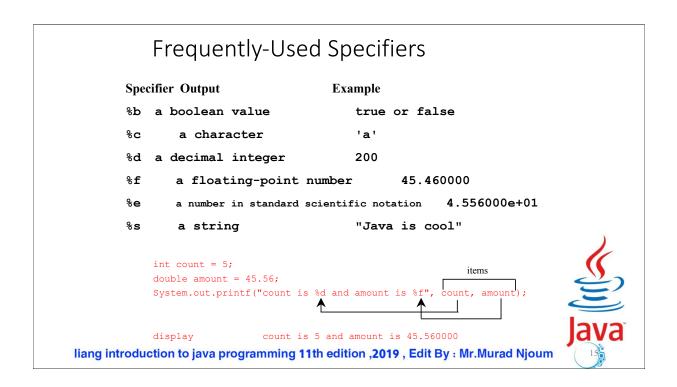

The String class provides several <u>static valueOf methods</u> for converting a character, an array of characters, and numeric values to strings. These methods have the same name <u>valueOf</u> with different argument types **char, char[], double, long, int, and float**. For example, to convert a double value to a string, use

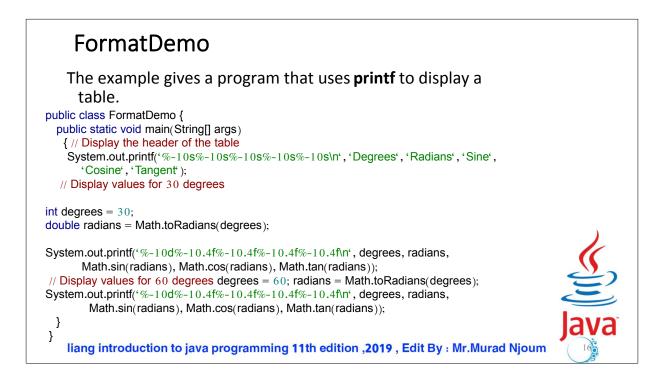

String.valueOf(5.44). The return value is string consists of characters '5' (.', '4', and '4'.

String.valueOf(tokens[0]).

Replacing and Splitting Strings

java.lang.String

+replace(oldChar: char, newChar: char): String +replaceFirst(oldString: String, newString: String): String +replaceAll(oldString: String, newString: String): String +split(delimiter: String): String[] Returns a new string that replaces all matching character in this string with the new character.Returns a new string that replaces the first matching substring in this string with the new substring.Returns a new string that replace all matching substrings in this string with the new substring.Returns an array of strings consisting of the substrings split by the delimiter.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

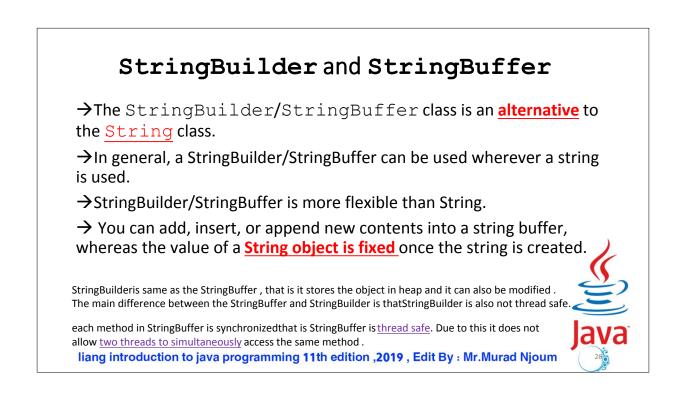

Splitting a String

```
String str="Java#HTML#Perl";
    String[] tokens = str.split("#");
    for (int i = 0; i < tokens.length; i++)
        System.out.print(tokens[i] + " ");
displays</pre>
```

The toString, capacity, length, setLength, and charAt Methods

java.lang.StringBuilder

+toString(): String +capacity(): int +charAt(index: int): char +length(): int +setLength(newLength: int): void +substring(startIndex: int): String +substring(startIndex: int, endIndex: int): String +trimToSize(): void

Returns a string object from the string builder. Returns the capacity of this string builder. **default capacity = 16** Returns the character at the specified index. Returns the number of characters in this builder. Sets a new length in this builder. Returns a substring starting at startIndex. Returns a substring from startIndex to endIndex-1.

Reduces the storage size used for the string builder.

Matching Strings "Java".matches("Java"); "Java".equals("Java"); "Java is fun".matches("Java.*") "Java is cool".matches("Java.*") "Java is powerful".matches("Java.*")

	Regular Expression	Matches	Example	
Regular Expression Syntax	x	a specified character x	Java matches Java	
		any single character	Java matches Ja	
	(ab cd)	ab or cd	ten matches t(en im)	
	[abc]	a, b, or c	Java matches Ja[uvwx]a	
	[^abc]	any character except a, b, or c	Java matches Ja[^ars]a	
	[a-z]	a through z	Java matches [A-M]av[a-d]	
"Java".matches("Ja");	[^a-z]	any character except a through z	Java matches Jav[^b-d]	
"Java".matches("J(av ba)a");	[a-e[m-p]]	a through e or m through p	<pre>Java matches [A-G[I-M]]av[a-d]</pre>	
	[a-e&&[c-p]]	intersection of a-e with c-p	<pre>Java matches [A-P&&[I-M]]av[a-d]</pre>	
	\d	a digit, same as [0-9]	<pre>Java2 matches "Java[\\d]"</pre>	
	\D	a non-digit	<pre>\$Java matches "[\\D][\\D]ava"</pre>	
	\w	a word character	<pre>Java1 matches "[\\w]ava[\\w]"</pre>	
	\W	a non-word character	<pre>\$Java matches "[\\W][\\w]ava"</pre>	
	\s	a whitespace character	"Java 2" matches "Java\\s2"	
	\\$	a non-whitespace char	Java matches "[\\S]ava"	
	₽ [≉]	zero or more occurrences of pattern p	aaaabb matches "a*bb" ababab matches "(ab)*"	
	<i>p</i> +	one or more occurrences of pattern p	a matches "a+b*" able matches "(ab)+.*"	10
	<i>p</i> ?	zero or one occurrence of pattern p	Java matches "J?Java" Java matches "J?ava"	2
	<i>p</i> {n}	exactly n occurrences of pattern p	<pre>Java matches "Ja{1}."" Java does not match ".{2}"</pre>	2
	<i>p</i> {n,}	at least n occurrences of pattern p	<pre>aaaa matches "a{1,}" a does not match "a{2,}"</pre>	-
	<i>p</i> {n,m}	between n and m occur- rences (inclusive)	<pre>aaaa matches "a{1,9}" abb does not match "a{2,9}bb"</pre>	lava

Object-Oriented Thinking

<u>Chapters 1-8</u> introduced fundamental programming techniques for problem solving using loops, methods, and arrays. The studies of these techniques lay a solid foundation for object-oriented programming. Classes provide more flexibility and modularity for building reusable software. This section improves the solution for a problem introduced in Chapter 3 **using the object-oriented approach**. From the improvements, you will gain the insight on the differences between the <u>procedural</u> <u>programming and object-oriented</u> programming and see the benefits of developing reusable code using objects and classes.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

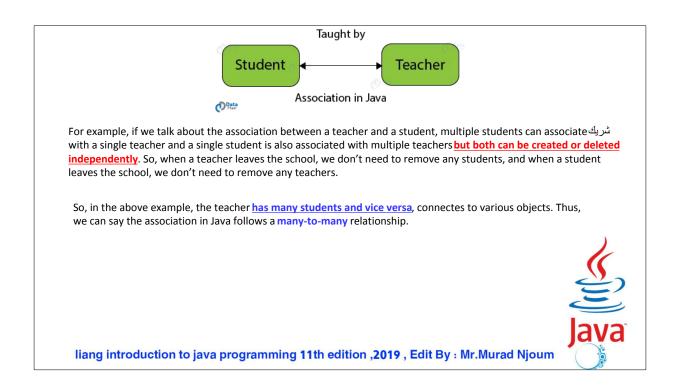

Association in Java is a connection between two separate classes that is set up through their objects. Although, Java association can balance, oneto-one, one-to-many, and many-to-many relationships. It defines the multiplicity between objects.

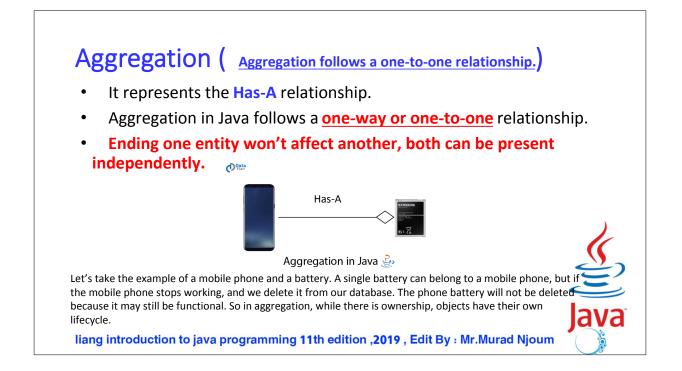

Is-A Relationship in Java

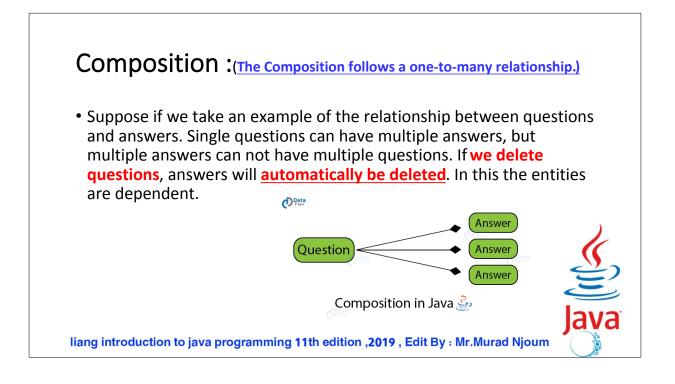

In Java, an <u>Is-A relationship depends on inheritance</u>. Further inheritance is of <u>two types, class inheritance and interface inheritance</u>. It is used for code reusability in Java. For example, a Potato is a vegetable, a Bus is a vehicle, a Bulb is an electronic device and so on. One of the properties of inheritance is that inheritance is <u>unidirectional</u> in nature. Like we can say that a <u>house is a building</u>. But not all buildings are houses. We can easily determine an Is-A relationship in Java. When there is an **extends** or implement keyword in the class declaration in Java then the specific class is said to be following the Is-A relationship.

Wrapper Classes

□Boolean □ Integer

Character

Long

□Short □ Float

Byte Double

NOTE:

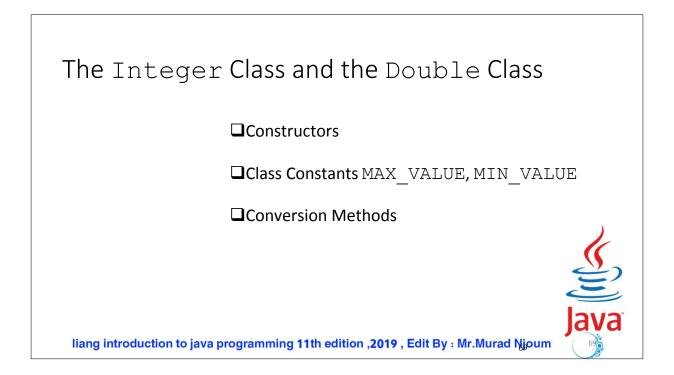

(1) The wrapper classes do not have no-arg constructors.

(2) The instances of all wrapper classes are **immutable**, i.e., their internativalues cannot be changed once the objects are created.

STUDENTS-HUB.com

Numeric Wrapper Class Constructors You can construct a wrapper object either from a primitive data type value or from a string representing the numeric value. The constructors for Integer and Double are: public Integer(int value) public Integer(int value) public Integer(String s) public Double(double value) public Double(String s) Integer ints=new Integer(10); System.out.print(ints.floatValue()); // 10.0

STUDENTS-HUB.com

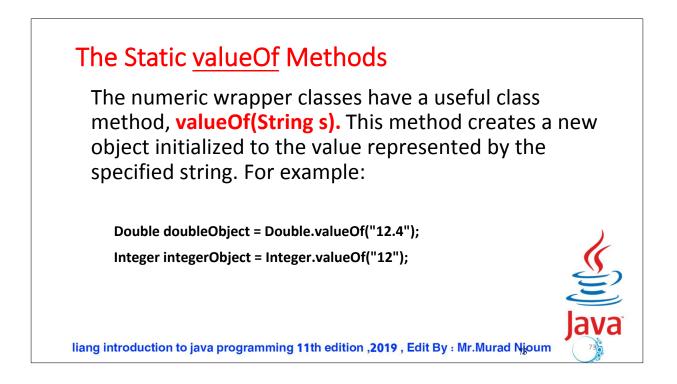

Numeric Wrapper Class Constants Each numerical wrapper class has the constants MAX_VALUE and MIN_VALUE. MAX_VALUE represents the maximum value of the corresponding primitive data type. For Byte, Short, Integer, and Long, MIN_VALUE represents the minimum byte, short, int, and long values. For Float and Double, MIN_VALUE represents the minimum positive float and double values. The following statements display the maximum integer (2,147,483,64), the minimum positive float (1.4E-45), and the maximum double floating-point number (1.79769313486231570e+308d). Iang introduction to java programming 11th edition, 2019, Edit By : Mr.Murad Njour

Conversion Methods

Each numeric wrapper class implements the abstract methods doubleValue, floatValue, intValue, longValue, and shortValue, which are defined in the <u>Number</u> class. These methods "convert" objects into primitive type values.

liang introduction to java programming 11th edition ,2019 , Edit By : Mr.Murad Njoum

The Methods for Parsing Strings into Numbers

You have used the **parseInt** method in the **Integer class** to parse a **numeric string** into an int value

and the parseDouble method in the Double class to parse a numeric string into a double value.

Each numeric wrapper class has two overloaded parsing methods to parse a numeric string into an appropriate numeric value.
