

2.6 limits involving infinity; Asymptotes of Graph (44)

Def 1) $f(x)$ has the limit L as x approaches infinity and we write $\lim_{x \rightarrow \infty} f(x) = L$ if for every $\epsilon > 0$,
 there exist a corresponding number M such that for all x
 $x > M \Rightarrow |f(x) - L| < \epsilon$.

2) $f(x)$ has the limit L as x approaches minus infinity and we write $\lim_{x \rightarrow -\infty} f(x) = L$ if for every $\epsilon > 0$, there
 exist a corresponding number N such that for all x
 $x < N \Rightarrow |f(x) - L| < \epsilon$.

Example: $y = \frac{1}{x}$ show that

a) $\lim_{x \rightarrow \infty} \frac{1}{x} = 0$ (b) $\lim_{x \rightarrow -\infty} \frac{1}{x} = 0$

a) Let $\epsilon > 0$. We need to find M such that for all x

if $x > M \Rightarrow \left| \frac{1}{x} - 0 \right| = \left| \frac{1}{x} \right| < \epsilon$ This is true if $M \geq \frac{1}{\epsilon}$
 This proves that $\lim_{x \rightarrow \infty} \frac{1}{x} = 0$

Uploaded By: Malak Obaid

b) let $\epsilon > 0$. We need to find N such that for all x

if $x < N \Rightarrow \left| \frac{1}{x} - 0 \right| = \left| \frac{1}{x} \right| < \epsilon \Rightarrow |x| > \frac{1}{\epsilon}$ This is true if $N \leq -\frac{1}{\epsilon}$
 This proves that $\lim_{x \rightarrow -\infty} \frac{1}{x} = 0$

Note that $\lim_{x \rightarrow \pm\infty} \frac{1}{x} = 0$ and $\lim_{x \rightarrow \pm\infty} K = K$

Limit at infinity of Rational functions

(45)

Example 1 $\lim_{x \rightarrow \infty}$

$$\frac{2x^2 - x + 4}{3x^2 + 5}$$

$$= \lim_{x \rightarrow \infty} \frac{2 - \frac{1}{x} + \frac{4}{x^2}}{3 + \frac{5}{x^2}}$$

$$= \frac{2}{3}$$

numerator $\rightarrow$
denominator $\rightarrow$

[2] $\lim_{x \rightarrow -\infty}$

$$\frac{8x - 6}{4x^3 + 1}$$

$$= \lim_{x \rightarrow -\infty} \frac{\frac{8}{x^2} - \frac{6}{x^3}}{4 + \frac{1}{x^3}}$$

$$= \frac{0 + 0}{4 + 0} = \frac{0}{4} = 0$$

Horizontal Asymptotes

Example: $y = \frac{1}{x}$

The horizontal line $y = 0$

"x-axis" is the horizontal asymptote of the graph $f(x) = \frac{1}{x}$

because $\lim_{x \rightarrow \infty} \frac{1}{x} = 0$ and $\lim_{x \rightarrow -\infty} \frac{1}{x} = 0$

Def

A line $y = b$ is a horizontal asymptote of the graph $y = f(x)$ if either $\lim_{x \rightarrow \infty} f(x) = b$ or $\lim_{x \rightarrow -\infty} f(x) = b$

Example 1 $\lim_{x \rightarrow \pm \infty} \frac{2x^2 - x + 4}{3x^2 + 5} = \frac{2}{3}$

$\Rightarrow y = \frac{2}{3}$ is a horizontal asymptote

[2] Find the horizontal asymptote of $f(x) = \frac{x^3 - 2}{|x|^3 + 1}$

• For $x \geq 0 \Rightarrow \lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{x^3 - 2}{x^3 + 1} = \lim_{x \rightarrow \infty} \frac{1 - \frac{2}{x^3}}{1 + \frac{1}{x^3}} = 1$

Uploaded By: Malak Obaid

• For $x \leq 0 \Rightarrow \lim_{x \rightarrow -\infty} f(x) = \lim_{x \rightarrow -\infty} \frac{x^3 - 2}{-x^3 + 1} = \lim_{x \rightarrow -\infty} \frac{1 - \frac{2}{x^3}}{-1 + \frac{1}{x^3}} = -1$

The horizontal asymptotes are $y = -1$ and $y = 1$

Example: Find (a) $\lim_{x \rightarrow \infty} \sin\left(\frac{1}{x}\right)$

(46)

take $t = \frac{1}{x}$ as $x \rightarrow \infty$, $t \rightarrow 0^+$

$$\lim_{x \rightarrow \infty} \sin\left(\frac{1}{x}\right) = \lim_{t \rightarrow 0^+} \sin t = 0$$

(b) $\lim_{x \rightarrow \pm\infty} x \sin\left(\frac{1}{x}\right)$

$$\lim_{x \rightarrow \infty} x \sin\left(\frac{1}{x}\right) = \lim_{t \rightarrow 0^+} \frac{\sin t}{t} = 1$$

$$\lim_{x \rightarrow -\infty} x \sin\left(\frac{1}{x}\right) = \lim_{t \rightarrow 0^-} \frac{\sin t}{t} = 1$$

Example: Find $\lim_{x \rightarrow \infty} (x - \sqrt{x^2 + 4}) = \lim_{x \rightarrow \infty} (x - \sqrt{x^2 + 4}) \cdot \frac{x + \sqrt{x^2 + 4}}{x + \sqrt{x^2 + 4}}$

$$= \lim_{x \rightarrow \infty} \frac{x^2 - (x^2 + 4)}{x + \sqrt{x^2 + 4}} = \lim_{x \rightarrow \infty} \frac{-4}{x + \sqrt{x^2 + 4}} = \lim_{x \rightarrow \infty} \frac{-\frac{4}{x}}{1 + \sqrt{1 + \frac{4}{x^2}}} = 0$$

Oblique Asymptotes

* If the degree of the numerator of a rational function is 1 greater than the degree of the denominator, then the graph has an oblique or slant line asymptote.

Example: Find the oblique asymptote of $f(x) = \frac{x^2 - 3}{2x - 4}$

STUDENTS-HUB.com

$$f(x) = \frac{x^2 - 3}{2x - 4} = \frac{\frac{x}{2} + 1}{1} + \frac{1}{2x - 4}$$

$\frac{x}{2} + 1$ is $g(x)$ (oblique Asymptotes) and $\frac{1}{2x - 4}$ is $r(x)$ (remainder). Oblique Asymptotes because

$$\lim_{x \rightarrow \infty} \frac{1}{2x - 4} = 0$$

$g(x)$ is dominant when x is large
 $r(x)$ is dominant when x is near 2

Uploaded By: Malak Obaid

Infinite limits

Example: Find

$$[a) \lim_{x \rightarrow 0^+} \frac{1}{x} = \infty$$

$$[b) \lim_{x \rightarrow 0^-} \frac{1}{x} = -\infty$$

$$[c) \lim_{x \rightarrow 1^+} \frac{1}{x-1} = \infty$$

$$[d) \lim_{x \rightarrow 1^-} \frac{1}{x-1} = -\infty$$

$$[e) \lim_{x \rightarrow 0^+} \frac{1}{x^2} = \infty$$

$$[f) \lim_{x \rightarrow 0^-} \frac{1}{x^2} = \infty$$

Note that in [a) and [c) ([b) and [d)] we are not saying the limit exists, nor that there is a real number ∞ . We are saying $\lim_{x \rightarrow 0^+} \frac{1}{x}$ DNE because $\frac{1}{x}$ becomes arbitrary large and positive as $x \rightarrow 0^+$

Def [1] $f(x)$ approaches infinity as x approaches x_0 and we write $\lim_{x \rightarrow x_0} f(x) = \infty$ if for every positive real number B , there exist a corresponding $\delta > 0$ such that for all x $0 < |x - x_0| < \delta \Rightarrow f(x) > B$.

[2) $f(x)$ approaches minus infinity as x approaches x_0 , and we write $\lim_{x \rightarrow x_0} f(x) = -\infty$ if for every negative number $-B$, there exists a corresponding $\delta > 0$ such that for all x $0 < |x - x_0| < \delta \Rightarrow f(x) < -B$

Example Prove that $\lim_{x \rightarrow 0} \frac{1}{x^2} = \infty$

let $B > 0$, we need to find $\delta > 0$ such that

$$0 < |x - 0| < \delta \Rightarrow \frac{1}{x^2} > B$$

$$x^2 < \frac{1}{B}$$

$$|x| < \frac{1}{\sqrt{B}}$$

$$\Rightarrow 0 < \delta \leq \frac{1}{\sqrt{B}} \quad \text{Now}$$

$$\text{If } |x| < \delta \text{ then } \frac{1}{x^2} > \frac{1}{\delta^2} \geq B$$

Therefore, by definition

$$\lim_{x \rightarrow 0} \frac{1}{x^2} = \infty$$

Vertical Asymptotes

48

Def A line $x=a$ is a vertical asymptote of the graph $y=f(x)$ if either $\lim_{x \rightarrow a^+} f(x) = \pm \infty$ or $\lim_{x \rightarrow a^-} f(x) = \pm \infty$

Find vertical asymptote of

Example: $y = \frac{1}{x}$

نقطة التي لا نهاية لها

$$\lim_{x \rightarrow 0^+} \frac{1}{x} = \infty$$

$$\text{and } \lim_{x \rightarrow 0^-} \frac{1}{x} = -\infty$$

$\Rightarrow (x=0)$ or $(y\text{-axis})$ is a vertical asymptote of $f(x) = \frac{1}{x}$

Example 1 Find the horizontal and vertical asymptotes of

$$y = \frac{x+3}{x+2} = 1 + \frac{1}{x+2}$$

For Horizontal asymptotes: we check as $x \rightarrow \pm \infty$

For Vertical asymptotes: we check as $x \rightarrow -2$

$$\lim_{x \rightarrow \pm \infty} \frac{x+3}{x+2} = \lim_{x \rightarrow \pm \infty} \frac{1 + \frac{3}{x}}{1 + \frac{2}{x}} = 1 \quad \text{"horizontal asymptote"} \\ y=1$$

$$\left[\begin{array}{l} \lim_{x \rightarrow -2^+} \frac{x+3}{x+2} = \frac{1}{\text{small positive}} = \infty \\ \lim_{x \rightarrow -2^-} \frac{x+3}{x+2} = \frac{1}{\text{small negative}} = -\infty \end{array} \right] \Rightarrow x = -2 \text{ is vertical asymptote}$$

② Find the horizontal and vertical asymptotes of

STUDENTS-HUB.com $y = \frac{8}{x^2 - 4}$

$$\begin{array}{l} \lim_{x \rightarrow -\infty} f(x) = 0 \\ \lim_{x \rightarrow +\infty} f(x) = 0 \end{array} \Rightarrow y=0 \text{ is horizontal asymptotes}$$

$$\begin{array}{l} \lim_{x \rightarrow 2^+} f(x) = -\infty \\ \lim_{x \rightarrow 2^-} f(x) = \infty \end{array} \Rightarrow x=2 \text{ is vertical asymptotes}$$

also $x = -2$ is vertical asymptotes

③ $y = \tan x$
odd multiple of $\frac{\pi}{2}$
