

Chapter 11: Parametric Curves

Def: A parametric Curve is given as $x=f(t), y=g(t)$
 $t \in I$

• Point $(x, y) = (f(t), g(t))$

How to Solve Exercises

• To find Cartesian Equations: Ex 4:- $x=3-3t, y=2t$ $0 \leq t \leq 1$

$x=3-3t$ $y=2t$

→ You have to find a relation between x and y with no t in it.

$x=3-3t$
 $\frac{y}{2}=t \Rightarrow \boxed{x=3-\frac{3y}{2}}$ Now you have to draw this

$x-3=-\frac{3y}{2}$
 $2x-6=-3y$
 $\frac{2x-6}{-3}=y \Rightarrow y=\frac{6-2x}{3}$

But $0 \leq t \leq 1$

Starting point at $t=0$

at $t=0$ $x=3$
 $y=0$

at $t=1$ $x=0$
 $y=2$ ← Terminating Point

Alireza Ebrahimi

• Finding Parametric Equations

$x = f(t)$, $y = g(t) \rightarrow$ are parametric equations

Ex 22 :- find a parametrization for the curve :
line segment with endpoints $(-1, 3)$ and $(3, -2)$

1- Since it's a line you can use line equation :-

$$y - b = m(x - a)$$

First:- Set $x = t + a$

$$\text{Now } y - b = m(t + a - a)$$

Then :- $y = mt + b$

2- find slope :- $m = \frac{-2-3}{3-(-1)} = \frac{-5}{4}$
using the two points given

$$x = t + a$$

$$y = -\frac{5}{4}t + b$$

$$-\infty < t < \infty$$

3- substituting point $(-1, 3)$ to know starting point

$$x = t - 1$$

$$y = -\frac{5}{4}t + 3$$

$\rightarrow$ at $t = 0$ is the starting point

4- Now to find the ending point let $(x, y) = (3, -2)$

$$3 = t - 1 \Rightarrow t = 4$$

$$-2 = -\frac{5}{4}t + 3$$

$$-5 = -\frac{5}{4}t$$

$$\Rightarrow t = 4$$

$\rightarrow$ at $t = 4$ is the ending point

5- So the parametrization is :- $x = t - 1$ at $0 \leq t \leq 4$
 $y = -\frac{5}{4}t + 3$
