Machine Learning

Basic Concepts

Terminology

Machine Learning, Data Science, Data Mining, Data Analysis, Statistical Learning, Knowledge Discovery in Databases, Pattern Discovery.

Data everywhere!

- 1. **Google:** processes 24 peta bytes of data per day.
- 2. Facebook: 10 million photos uploaded every hour.
- 3. Youtube: 1 hour of video uploaded every second.
- 4. **Twitter:** 400 million tweets per day.
- 5. Astronomy: Satellite data is in hundreds of PB.

6. . . .

7. "By 2020 the digital universe will reach 44 zettabytes..."

The Digital Universe of Opportunities: Rich Data and the Increasing Value of the Internet of Things, April 2014. That's 44 trillion gigabytes!

Data types

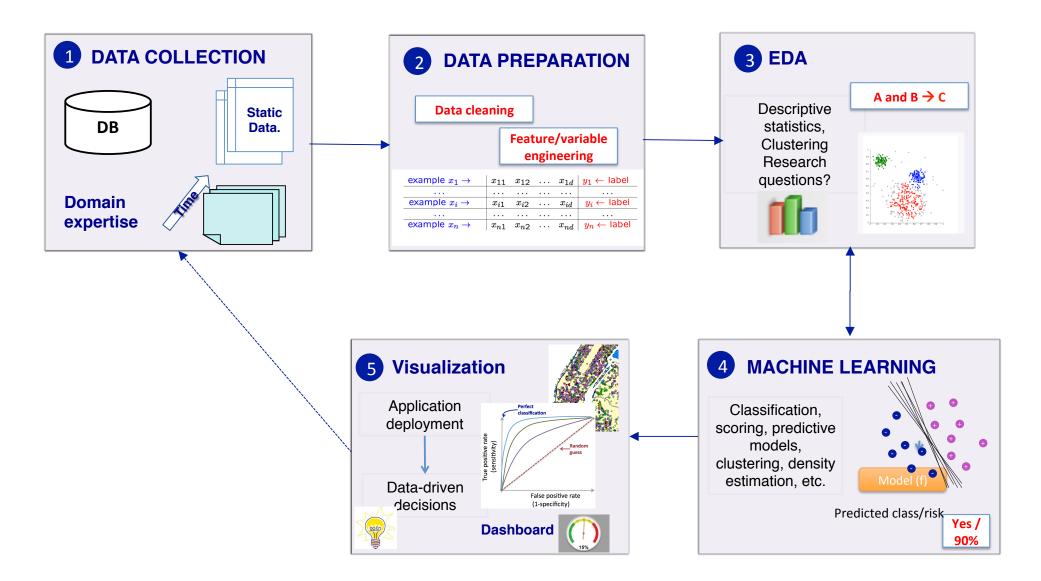

Data comes in different sizes and also flavors (types):

- \boxtimes Texts
- ⊠ Numbers
- **⊠** Clickstreams
- \boxtimes Graphs
- \boxtimes Tables
- \boxtimes Images
- **⊠** Transactions
- \boxtimes Videos
- \boxtimes Some or all of the above!

Smile, we are 'DATAFIED'!

- Wherever we go, we are "datafied".
- Smartphones are tracking our locations.
- We leave a data trail in our web browsing.
- Interaction in social networks.
- Privacy is an important issue in Data Science.

The Data Science process

Applications of ML

• We all use it on a daily basis. Examples:

Machine Learning

- Spam filtering
- Credit card fraud detection
- Digit recognition on checks, zip codes
- Detecting faces in images
- MRI image analysis
- Recommendation system
- Search engines
- Handwriting recognition
- Scene classification
- etc...

Interdisciplinary field

STUDENTS-HUB.com

ML versus Statistics

Statistics:

- Hypothesis testing
- Experimental design
- Anova
- Linear regression
- Logistic regression
- GLM
- PCA

Machine Learning:

- Decision trees
- Rule induction
- Neural Networks
- SVMs
- Clustering method
- Association rules
- Feature selection
- Visualization
- Graphical models
- Genetic algorithm

Machine Learning definition

"How do we create computer programs that improve with experience?"

Tom Mitchell

http://videolectures.net/mlas06_mitchell_itm/

Machine Learning definition

"How do we create computer programs that improve with experience?"

Tom Mitchell

http://videolectures.net/mlas06_mitchell_itm/

"A computer program is said to **learn** from experience E with respect to some class of tasks T and performance measure P, if its performance at tasks in T, as measured by P, improves with experience E."

Tom Mitchell. Machine Learning 1997.

Supervised vs. Unsupervised

Given: Training data: $(x_1, y_1), \ldots, (x_n, y_n) / x_i \in \mathbb{R}^d$ and y_i is the label.

example $x_1 \rightarrow$	$ x_{11} $	x_{12}	• • •	x_{1d}	$y_1 \leftarrow label$
• • •	• • •	• • •	• • •	• • •	•••
example $x_i \rightarrow$	x_{i1}	x_{i2}	• • •	x_{id}	$y_i \leftarrow label$
	•••	• • •	• • •	• • •	•••
example $x_n \rightarrow$	x_{n1}	x_{n2}	• • •	x_{nd}	$y_n \leftarrow label$

Supervised vs. Unsupervised

Given: Training data: $(x_1, y_1), \ldots, (x_n, y_n) / x_i \in \mathbb{R}^d$ and y_i is the label.

example $x_1 \rightarrow$	$ x_{11} $	x_{12}	• • •	x_{1d}	$y_1 \leftarrow label$
• • •	• • •	• • •	• • •	• • •	•••
example $x_i \rightarrow$	x_{i1}	x_{i2}	• • •	x_{id}	$y_i \leftarrow label$
• • •	•••	• • •	• • •	• • •	•••
example $x_n \rightarrow$	x_{n1}	x_{n2}	• • •	x_{nd}	$y_n \leftarrow label$

fruit	length	width	weight	label
fruit 1	165	38	172	Banana
fruit 2	218	39	230	Banana
fruit 3	76	80	145	Orange
fruit 4	145	35	150	Banana
fruit 5	90	88	160	Orange
fruit n				

Supervised vs. Unsupervised

fruit	length	width	weight	label
fruit 1	165	38	172	Banana
fruit 2	218	39	230	Banana
fruit 3	76	80	145	Orange
fruit 4	145	35	150	Banana
fruit 5	90	88	160	Orange
fruit n				

Unsupervised learning:

Learning a model from **unlabeled** data.

Supervised learning:

Learning a model from **labeled** data.

Unsupervised Learning

Training data: "examples" x.

 $x_1,\ldots,x_n, x_i \in X \subset \mathbb{R}^n$

• Clustering/segmentation:

 $f : \mathbb{R}^d \longrightarrow \{C_1, \dots C_k\}$ (set of clusters).

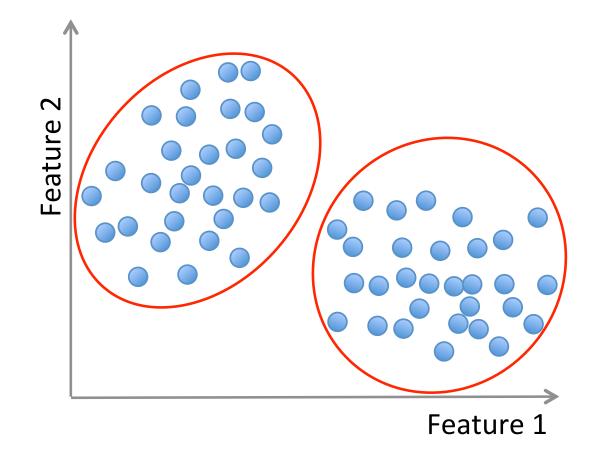

Example: Find clusters in the population, fruits, species.

Unsupervised learning

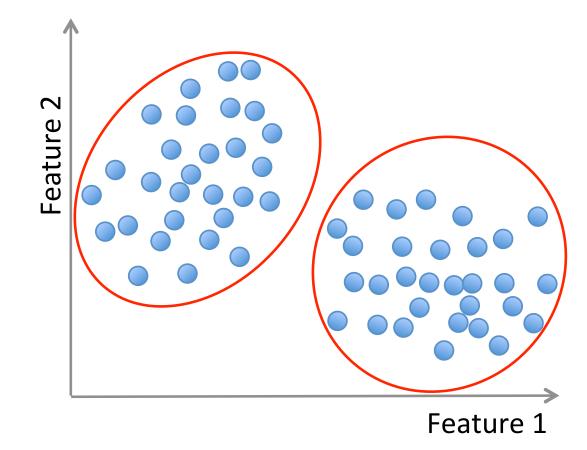

STUDENTS-HUB.com

Unsupervised learning

STUDENTS-HUB.com

Unsupervised learning

Methods: K-means, gaussian mixtures, hierarchical clustering, spectral clustering, etc.

STUDENTS-HUB.com

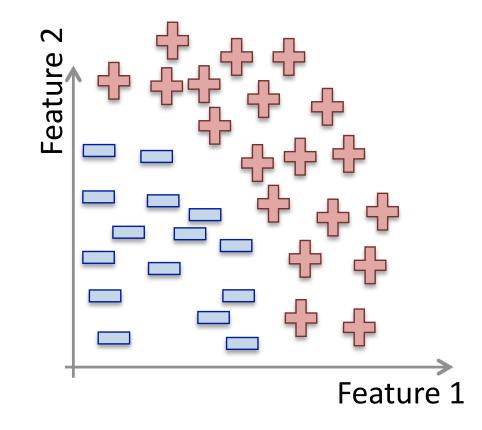

Training data: "examples" x with "labels" y.

 $(x_1, y_1), \dots, (x_n, y_n) / x_i \in \mathbb{R}^d$

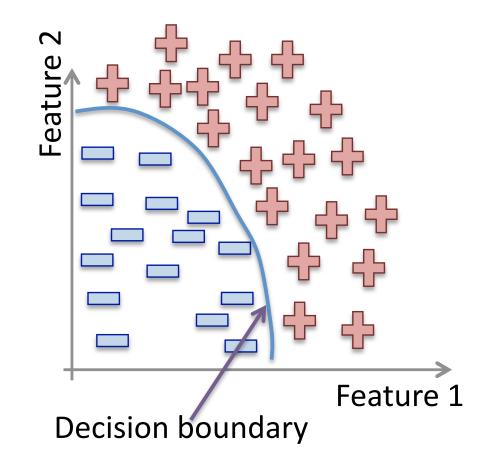

• Classification: y is discrete. To simplify, $y \in \{-1, +1\}$

 $f : \mathbb{R}^d \longrightarrow \{-1, +1\}$ f is called a **binary classifier**.

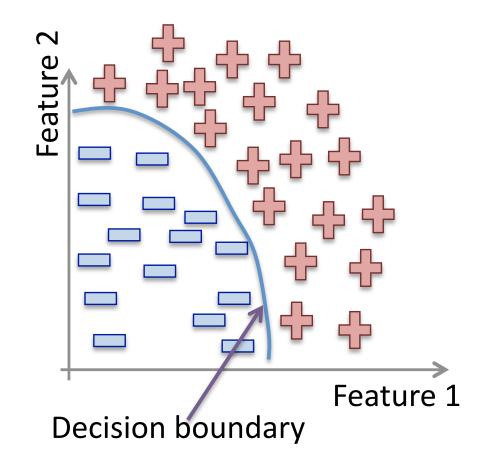

Example: Approve credit yes/no, spam/ham, banana/orange.

STUDENTS-HUB.com

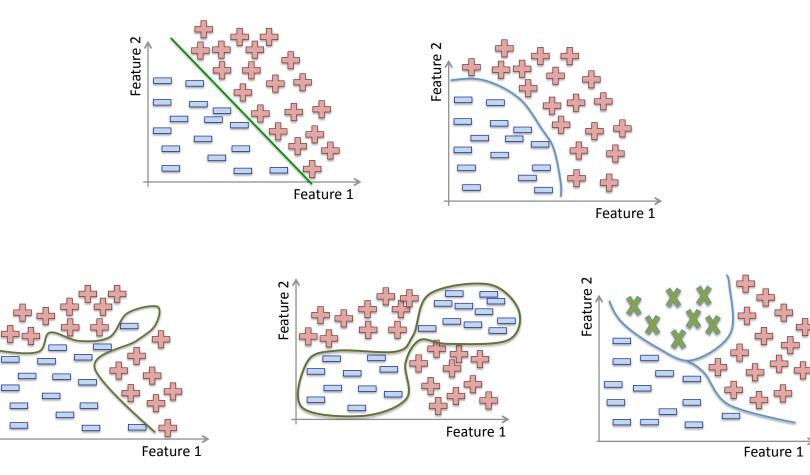

STUDENTS-HUB.com

Methods: Support Vector Machines, neural networks, decision trees, K-nearest neighbors, naive Bayes, etc.

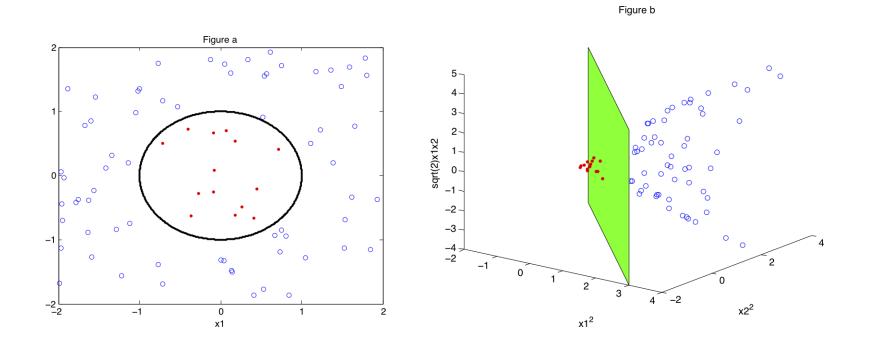

STUDENTS-HUB.com

Classification:

Feature 2

Non linear classification

STUDENTS-HUB.com

Training data: "examples" x with "labels" y.

 $(x_1, y_1), \dots, (x_n, y_n) / x_i \in \mathbb{R}^d$

• **Regression:** y is a real value, $y \in \mathbb{R}$

 $f : \mathbb{R}^d \longrightarrow \mathbb{R}$ f is called a **regressor**. Example: amount of credit, weight of fruit.

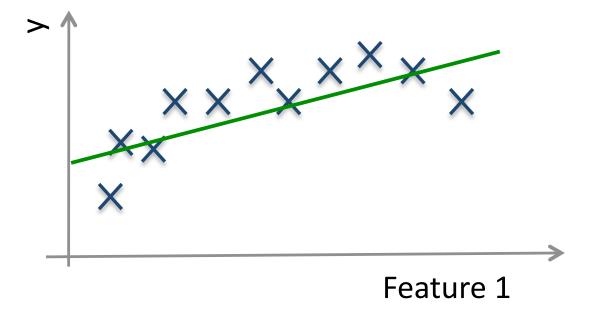

Regression:

Example: Income in function of age, weight of the fruit in function of its length.

Training and Testing

STUDENTS-HUB.com

Training and Testing

- Not every ML method builds a model!
- Our first ML method: KNN.
- Main idea: Uses the **similarity** between examples.
- Assumption: Two similar examples should have same labels.
- Assumes all examples (instances) are points in the d dimensional space \mathbb{R}^d .

• KNN uses the standard **Euclidian distance** to define nearest neighbors.

Given two examples x_i and x_j :

$$d(x_i, x_j) = \sqrt{\sum_{k=1}^{d} (x_{ik} - x_{jk})^2}$$

Training algorithm:

Add each training example (x, y) to the dataset \mathcal{D} . $x \in \mathbb{R}^d$, $y \in \{+1, -1\}$.

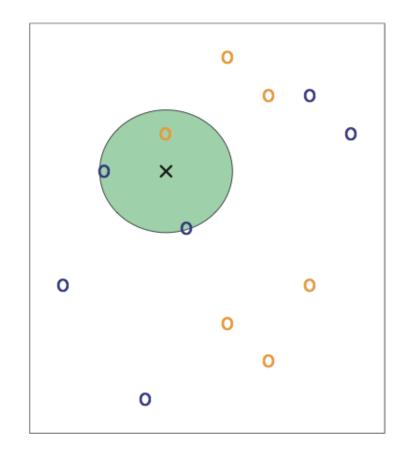

Training algorithm:

Add each training example (x, y) to the dataset \mathcal{D} . $x \in \mathbb{R}^d$, $y \in \{+1, -1\}$.

Classification algorithm:

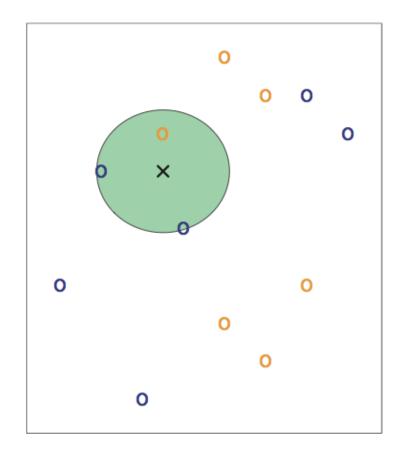

Given an example x_q to be classified. Suppose $N_k(x_q)$ is the set of the K-nearest neighbors of x_q .

$$\hat{y}_q = sign(\sum_{x_i \in N_k(x_q)} y_i)$$

Question: Draw an approximate decision boundary for K = 3?

STUDENTS-HUB.com

Credit: Introduction to Statistical Learning.

Question: What are the pros and cons of K-NN?

STUDENTS-HUB.com

Question: What are the pros and cons of K-NN?

Pros:

- + Simple to implement.
- + Works well in practice.
- + Does not require to build a model, make assumptions, tune parameters.
- + Can be extended easily with news examples.

Question: What are the pros and cons of K-NN?

Pros:

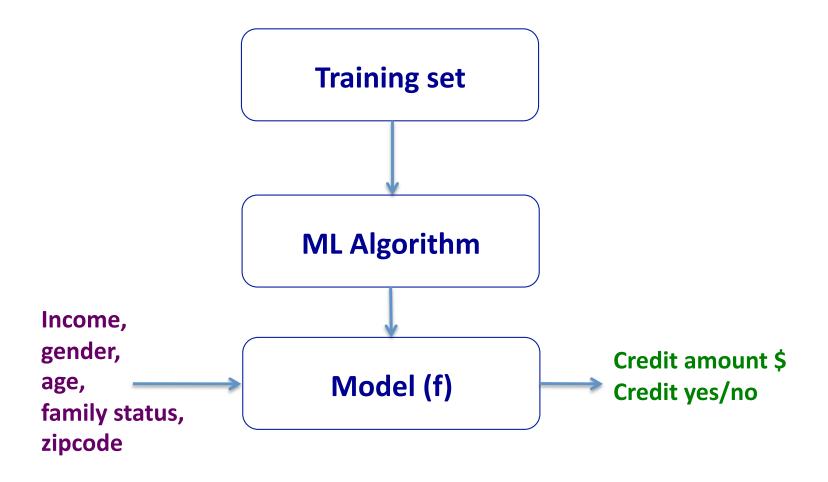

- + Simple to implement.
- + Works well in practice.
- + Does not require to build a model, make assumptions, tune parameters.
- + Can be extended easily with news examples.

Cons:

- Requires large space to store the entire training dataset.
- Slow! Given n examples and d features. The method takes $O(n \times d)$ to run.
- Suffers from the *curse of dimensionality*.

Applications of K-NN

- 1. Information retrieval.
- 2. Handwritten character classification using nearest neighbor in large databases.
- 3. Recommender systems (user like you may like similar movies).
- 4. Breast cancer diagnosis.
- 5. Medical data mining (similar patient symptoms).
- 6. Pattern recognition in general.

Question: How can we be confident about f?

• We calculate E^{train} the in-sample error (training error or empirical error/risk).

$$E^{train}(f) = \sum_{i=1}^{n} loss(y_i, f(x_i))$$

• We calculate E^{train} the in-sample error (training error or empirical error/risk).

$$E^{train}(f) = \sum_{i=1}^{n} loss(y_i, f(x_i))$$

- Examples of loss functions:
 - Classification error:

$$loss(y_i, f(x_i)) = \begin{cases} 1 & \text{if } sign(y_i) \neq sign(f(x_i)) \\ 0 & \text{otherwise} \end{cases}$$

• We calculate E^{train} the in-sample error (training error or empirical error/risk).

$$E^{train}(f) = \sum_{i=1}^{n} loss(y_i, f(x_i))$$

- Examples of loss functions:
 - Classification error:

$$loss(y_i, f(x_i)) = \begin{cases} 1 & \text{if } sign(y_i) \neq sign(f(x_i)) \\ 0 & \text{otherwise} \end{cases}$$

- Least square loss:

$$loss(y_i, f(x_i)) = (y_i - f(x_i))^2$$

STUDENTS-HUB.com

• We calculate E^{train} the in-sample error (training error or empirical error/risk).

$$E^{train}(f) = \sum_{i=1}^{n} loss(y_i, f(x_i))$$

• We aim to have $E^{train}(f)$ small, i.e., minimize $E^{train}(f)$

• We calculate E^{train} the in-sample error (training error or empirical error/risk).

$$E^{train}(f) = \sum_{i=1}^{n} loss(y_i, f(x_i))$$

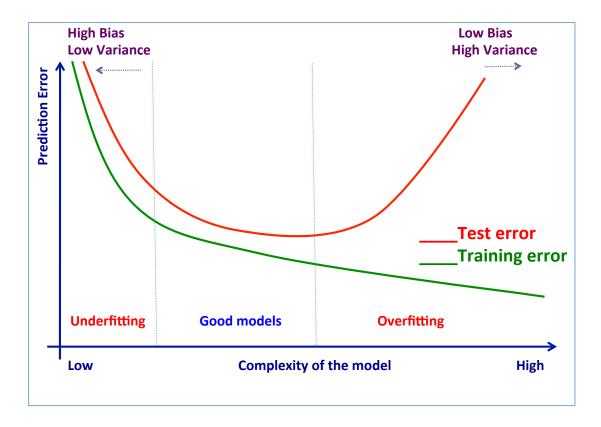

- We aim to have $E^{train}(f)$ small, i.e., minimize $E^{train}(f)$
- We hope that $E^{test}(f)$, the out-sample error (test/true error), will be small too.

Overfitting/underfitting

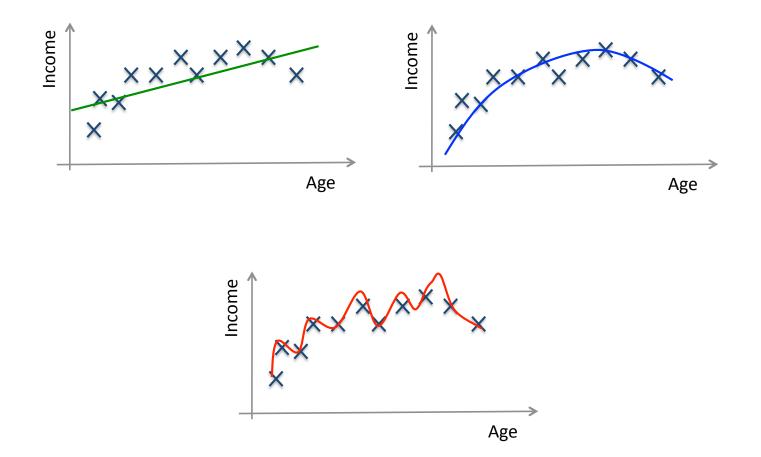

STUDENTS-HUB.com

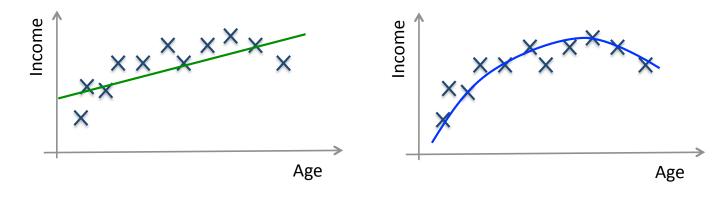

Structural Risk Minimization

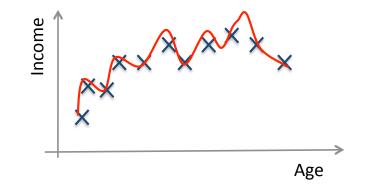

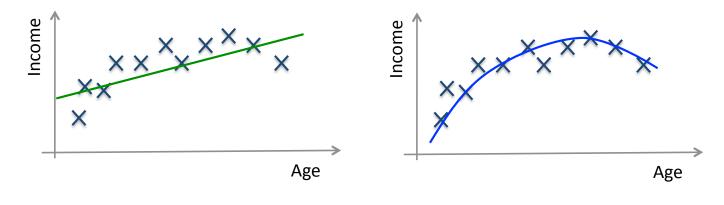

STUDENTS-HUB.com

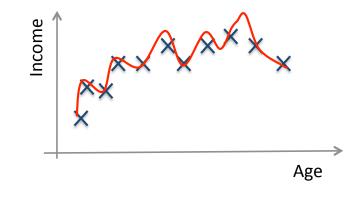

High bias (underfitting)

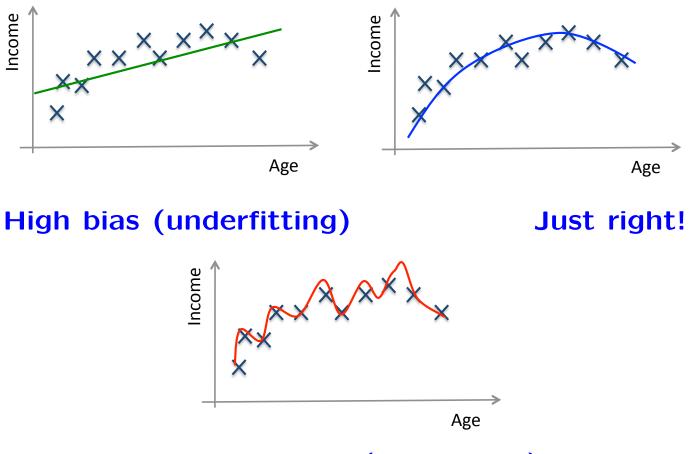

High bias (underfitting)

High variance (overfitting)

STUDENTS-HUB.com

High variance (overfitting)

STUDENTS-HUB.com

Avoid overfitting

In general, use simple models!

- Reduce the number of features manually or do feature selection.
- Do a model selection (ML course).
- Use **regularization** (keep the features but reduce their importance by setting small parameter values) (ML course).
- Do a **cross-validation** to estimate the test error.

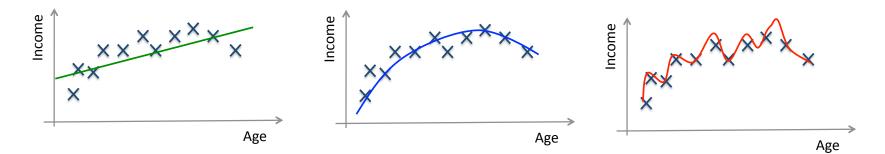

Regularization: Intuition

We want to minimize:

Classification term $+ C \times \text{Regularization term}$

$$\sum_{i=1}^{n} loss(y_i, f(x_i)) + C \times R(f)$$

Regularization: Intuition

 $f(x) = \lambda_0 + \lambda_1 x \dots (1)$ $f(x) = \lambda_0 + \lambda_1 x + \lambda_2 x^2 \dots (2)$ $f(x) = \lambda_0 + \lambda_1 x + \lambda_2 x^2 + \lambda_3 x^3 + \lambda_4 x^4 \dots (3)$

Hint: Avoid high-degree polynomials.

Example: Split the data randomly into 60% for training, 20% for validation and 20% for testing.

1. Training set is a set of examples used for learning a model (e.g., a classification model).

LIDATION TEST

- Training set is a set of examples used for learning a model (e.g., a classification model).
- Validation set is a set of examples that cannot be used for learning the model but can help tune model parameters (e.g., selecting K in K-NN). Validation helps control overfitting.

ALIDATION

TEST

- 1. Training set is a set of examples used for learning a model (e.g., a classification model).
- Validation set is a set of examples that cannot be used for learning the model but can help tune model parameters (e.g., selecting K in K-NN). Validation helps control overfitting.
- 3. Test set is used to assess the performance of the final model and provide an estimation of the test error.

TRAIN

ALIDATION

TEST

- 1. Training set is a set of examples used for learning a model (e.g., a classification model).
- Validation set is a set of examples that cannot be used for learning the model but can help tune model parameters (e.g., selecting K in K-NN). Validation helps control overfitting.
- 3. Test set is used to assess the performance of the final model and provide an estimation of the test error.

Note: Never use the test set in any way to further tune the parameters or revise the model.

K-fold Cross Validation

A method for estimating test error using training data.

Algorithm:

Given a learning algorithm ${\mathcal A}$ and a dataset ${\mathcal D}$

Step 1: Randomly partition \mathcal{D} into k equal-size subsets $\mathcal{D}_1, \ldots, \mathcal{D}_k$

Step 2: For j = 1 to kTrain \mathcal{A} on all \mathcal{D}_i , $i \in 1, \ldots k$ and $i \neq j$, and get f_j . Apply f_j to \mathcal{D}_j and compute $E^{\mathcal{D}_j}$

Step 3: Average error over all folds.

$$\sum_{j=1}^{k} (E^{\mathcal{D}_j})$$

Confusion matrix

		Actual Label	
		Positive	Negative
Predicted Label	Positive	True Positive (TP)	False Positive (FP)
	Negative	False Negative (FN)	True Negative (TN)

Evaluation metrics

		Actual Label	
		Positive	Negative
Predicted Label	Positive	True Positive (TP)	False Positive (FP)
	Negative	False Negative (FN)	True Negative (TN)

Accuracy	(TP + TN) / (TP + TN + FP + FN)	The percentage of predictions that are correct
Precision	TP / (TP + FP)	The percentage of positive predictions that are correct
Sensitivity (Recall)	TP / (TP + FN)	The percentage of positive cases that were predicted as positive
Specificity	TN / (TN + FP)	The percentage of negative cases that were predicted as negative

Terminology review

Review the concepts and terminology:

Instance, example, feature, label, supervised learning, unsupervised learning, classification, regression, clustering, prediction, training set, validation set, test set, K-fold cross validation, classification error, loss function, overfitting, underfitting, regularization.

Classification

Given: Training data: $(x_1, y_1), \ldots, (x_n, y_n)/x_i \in \mathbb{R}^d$ and y_i is discrete (categorical/qualitative), $y_i \in \mathbb{Y}$.

Example $\mathbb{Y} = \{-1, +1\}, \mathbb{Y} = \{0, 1\}.$

Task: Learn a classification function:

 $f:\mathbb{R}^d\longrightarrow\mathbb{Y}$

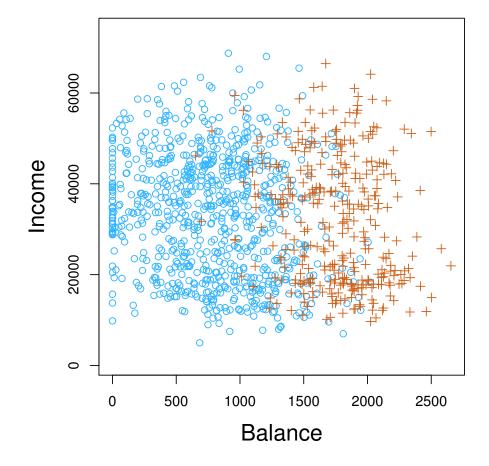

Linear Classification: A classification model is said to be linear if it is represented by a linear function f (linear hyperplane)

Classification: examples

- 1. Fruit classification \rightarrow Banana/Orange?
- 2. Email Spam/Ham \rightarrow Which email is junk?
- 3. Tumor benign/malignant \rightarrow Which patient has cancer?
- 4. Credit default/not default \rightarrow Which customers will default on their credit card debt?

Balance	Income	Default
300	\$20,000.00	no
2000	\$60,000.00	no
5000	\$45,000.00	yes

Classification: example

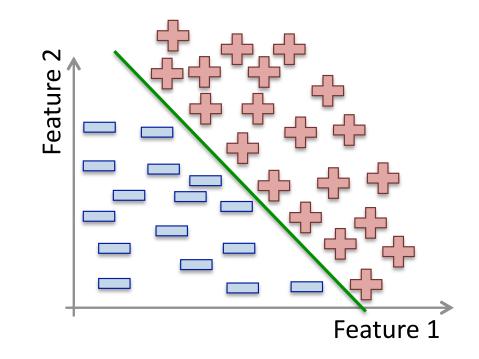

Credit: Introduction to Statistical Learning.

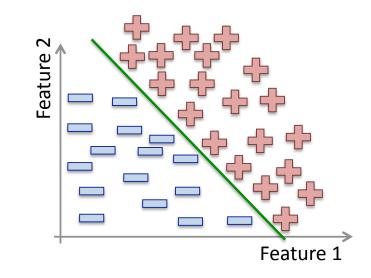

STUDENTS-HUB.com

- Belongs to Neural Networks class of algorithms (algorithms that try to mimic how the brain functions).
- The first algorithm used was the Perceptron (Resenblatt 1959).
- Worked extremely well to recognize:
 - 1. handwritten characters (LeCun et a. 1989),
 - 2. spoken words (Lang et al. 1990),
 - 3. faces (Cottrel 1990)
- NN were popular in the 90's but then lost some of its popularity.
- Now NN back with deep learning.

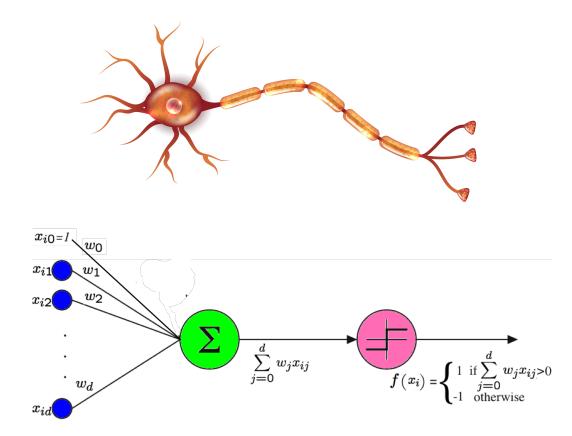

Perfectly separable data

STUDENTS-HUB.com

- Linear classification method.
- Simplest classification method.
- Simplest neural network.
- For perfectly separated data.

Given n examples and d features.

$$f(x_i) = sign(\sum_{j=0}^d w_j x_{ij})$$

STUDENTS-HUB.com

- Works perfectly if data is linearly separable. If not, it will not converge.
- Idea: Start with a random hyperplane and adjust it using your training data.
- Iterative method.

Perceptron Algorithm

Input: A set of examples, $(x_1, y_1), \dots, (x_n, y_n)$ **Output:** A perceptron defined by (w_0, w_1, \dots, w_d)

Begin

- 2. Initialize the weights w_j to $\forall j \in \{0, \dots, d\}$
- 3. Repeat until convergence
 - 4. For each example $x_i \ \forall i \in \{1, \cdots, n\}$

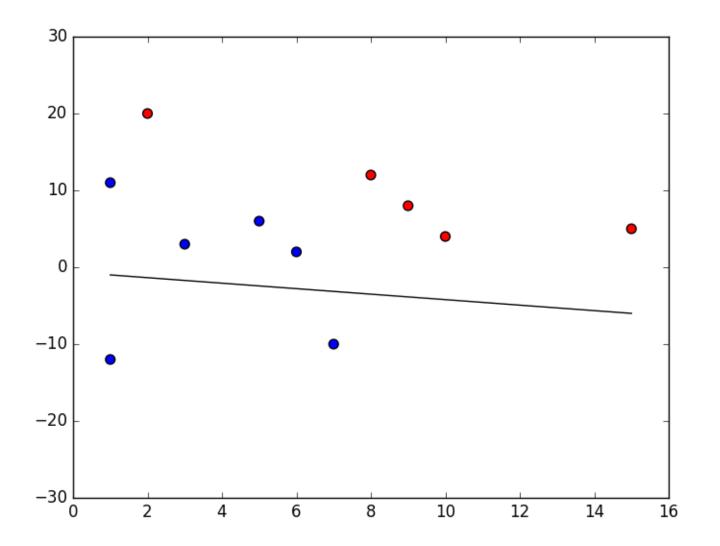

5. if
$$y_i f(x_i) \leq 0$$
 #an error?

6. update all w_j with $w_j := w_j + y_i x_i \#$ adjust the weights

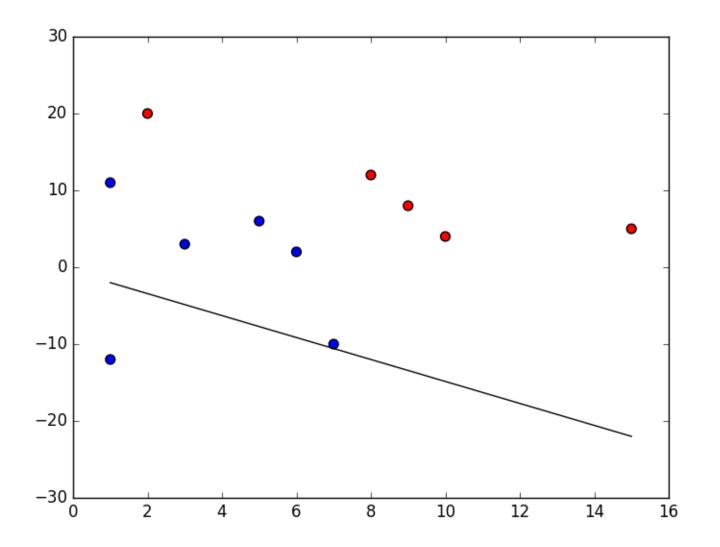

End

Some observations:

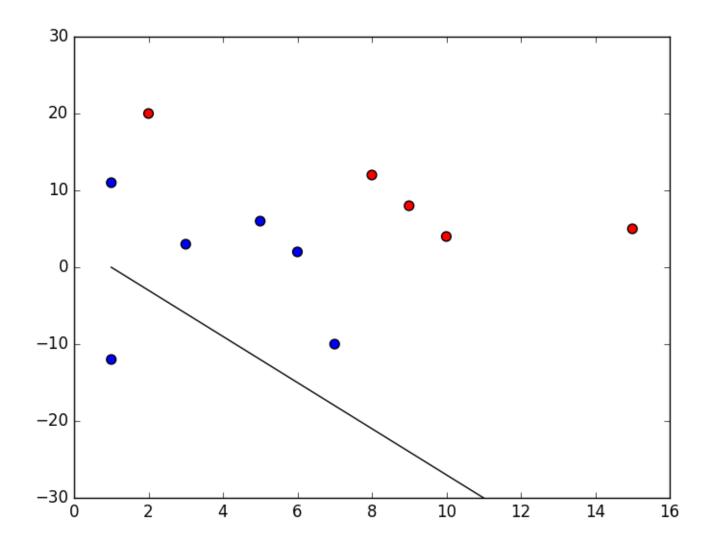

- The weights w_1, \ldots, w_d determine the slope of the decision boundary.
- w_0 determines the offset of the decision boundary (sometimes noted b).
- Line 6 corresponds to: Mistake on positive: add x to weight vector. Mistake on negative: substract x from weight vector. Some other variants of the algorithm add or subtract 1.
- Convergence happen when the weights do not change anymore (difference between the last two weight vectors is 0).

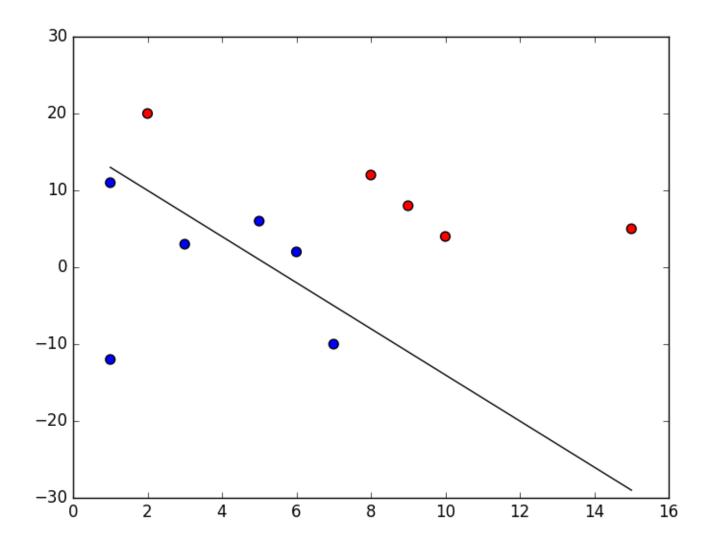

STUDENTS-HUB.com

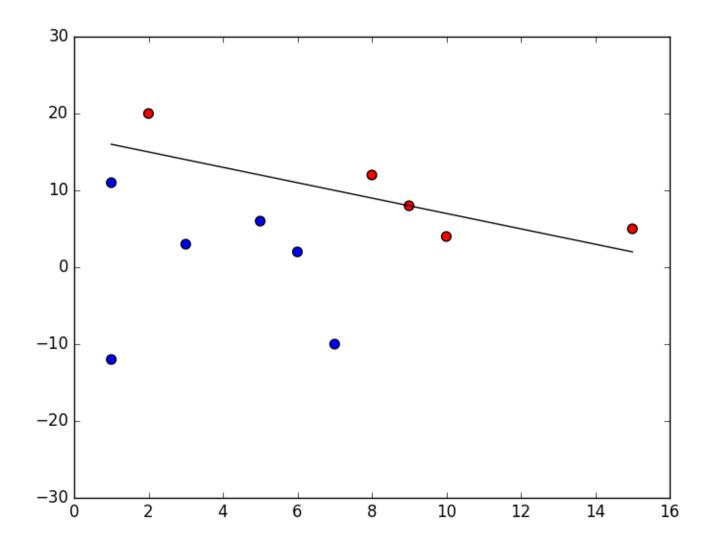

STUDENTS-HUB.com

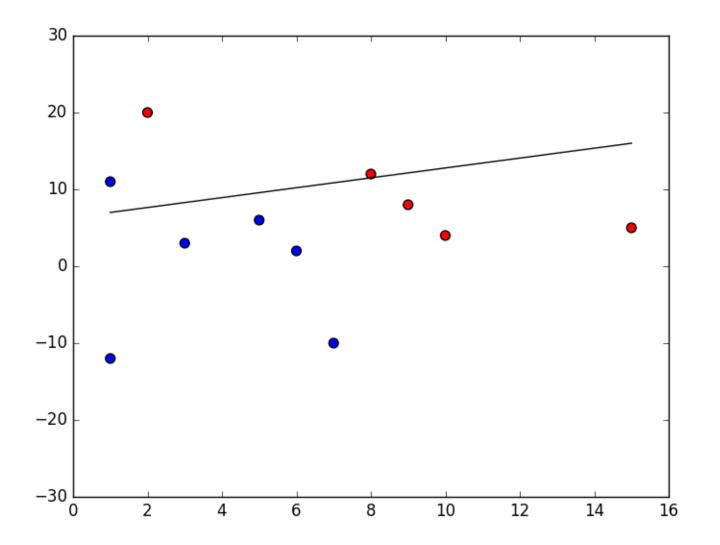

STUDENTS-HUB.com

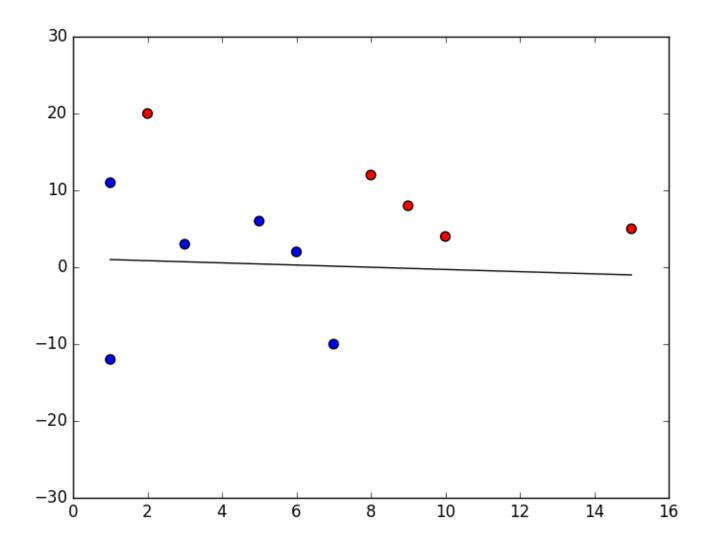

STUDENTS-HUB.com

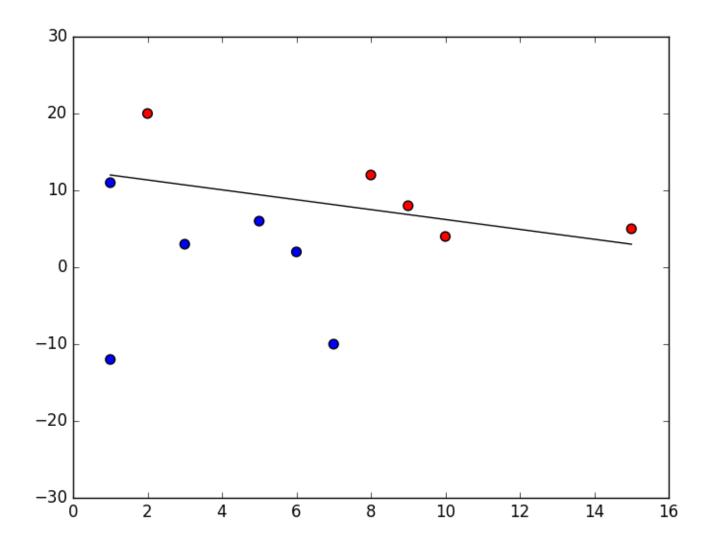

STUDENTS-HUB.com

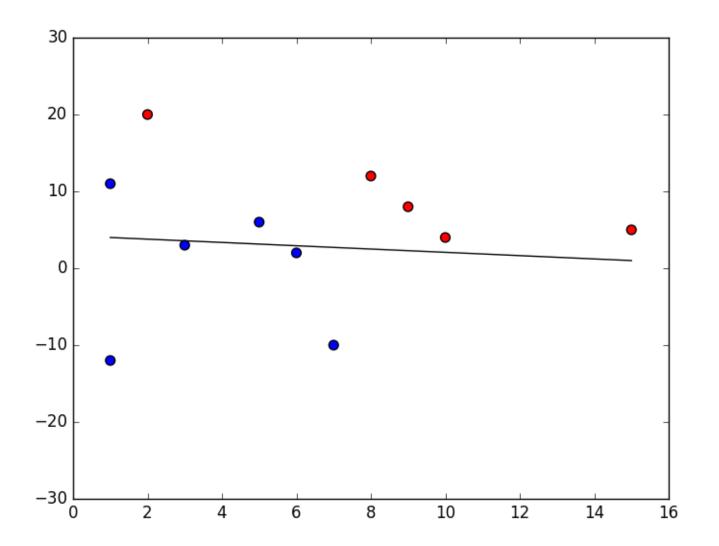

STUDENTS-HUB.com

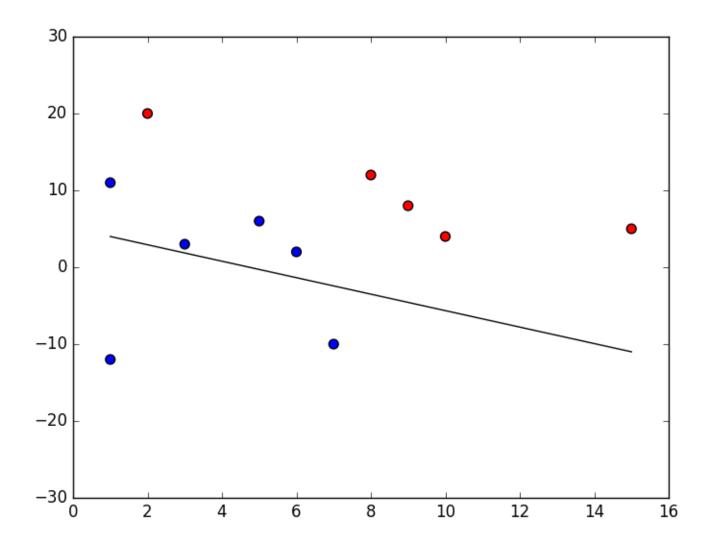

STUDENTS-HUB.com

STUDENTS-HUB.com

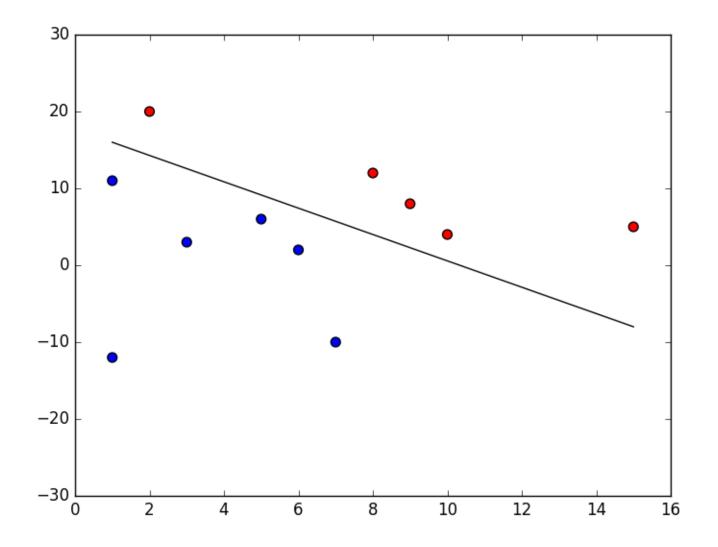

STUDENTS-HUB.com

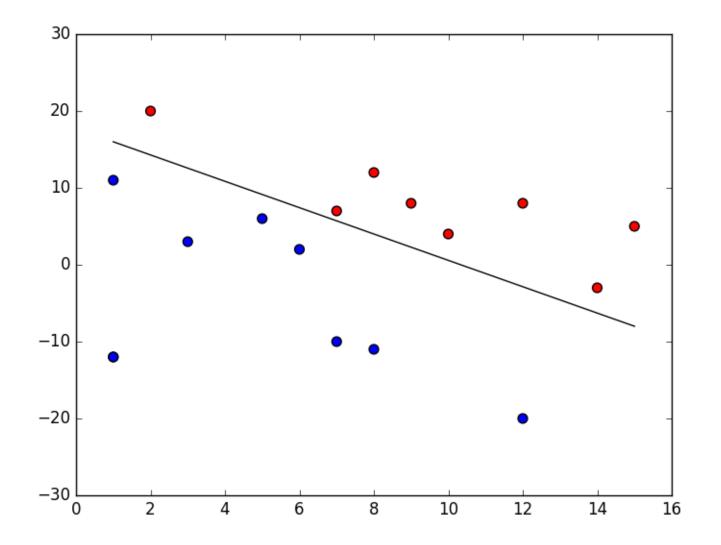

STUDENTS-HUB.com

Finally converged!

STUDENTS-HUB.com

With some test data:

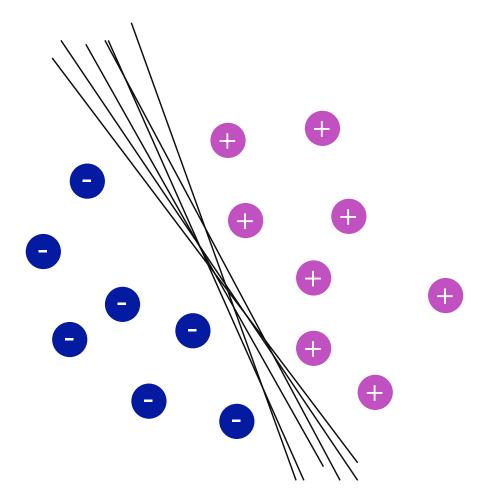

STUDENTS-HUB.com

- The w_i determine the contribution of x_i to the label.
- $-w_0$ is a quantity that $\sum_{i=1}^n w_i x_1$ needs to exceed for the perceptron to output 1.
- Can be used to represent many Boolean functions: AND, OR, NAND, NOR, NOT but not all of them (e.g., XOR).

From perceptron to NN

- Neural networks use the ability of the perceptrons to represent elementary functions and combine them in a network of layers of elementary questions.
- However, a cascade of linear functions is still linear!
- And we want networks that represent highly non-linear functions.

Choice of the hyperplane

Lots of possible solutions! Digression: Idea of SVM is to find the optimal solution.
